

## THE VIRTUAL WARDS CONFERENCE

Thursday 29th February | 15Hatfields, London

Agenda for today:

Welcome to The Virtual Wards  
Conference!

29th February 2024  
9am – 5:30pm  
15Hatfields, London

## Chairs Opening Address

**Dr Gurnak Singh Dosanjh**  
GP and ICB Clinical Lead for Home First  
Leicester, Leicestershire and Rutland ICB

## Slido

Please scan the QR Code on the screen. This will take you through to Slido, where you can interact with us.

**SCAN ME**

## THE VIRTUAL WARDS CONFERENCE

NHS Implementation and best  
practice

## Speaking Now...

**Adam Fitzgerald**

Head of Nursing, Integrated Local Services  
Guy's and St Thomas' NHS Foundation  
Trust

# Lambeth and Southwark Virtual Wards

Adam Fitzgerald  
Harriet Slade

**NHS VIRTUAL WARDS SOUTH CONFERENCE**

28 February 2024

Collaborative ICS (place based) challenges and how we're overcoming this to create the opportunity to develop a coordinated approach to caring for more patients outside of hospital in an environment familiar to them such as their own home

# Local context: South East London system

Overview of **current workforce estimates in SEL** across health and care.

Workforce in excess of **132,084** employed by:

- 341 Pharmacies
- 210 GP Practices
- 2 Mental Health Providers
- 4 Community Providers
- 3 Acute Trusts
- 6 Local Authorities
- 1 Integrated Care Board
- 11 Specialist Palliative Care Community Providers

## Insights

**Vacancies:** High vacancy rates for health and social care staff;

**Retirement Risk:** Ageing workforce;

**Pay:** Pay disparity between Health & Social Care;

**Retention:** High turnover rates;

**Carers:** Significant levels of unpaid carers (est.upwards 26,000).

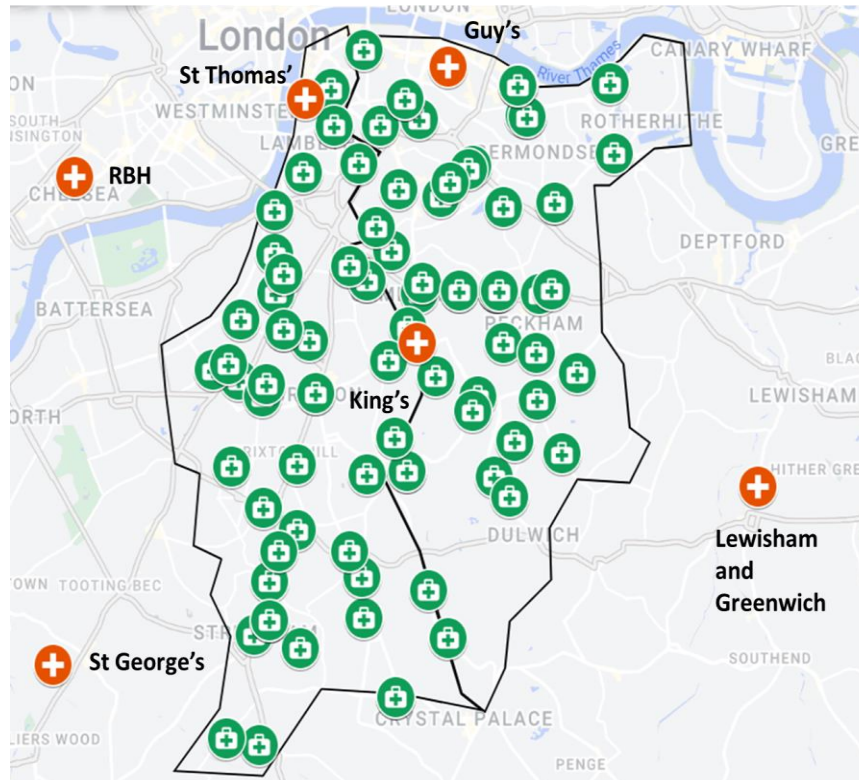

**Competition:** For staff across providers.

Organisation	Headcount
Adult Social Care (Independent sector) <sup>1</sup>	37,000
Voluntary Sector Employees <sup>2</sup> (crude split London/5)	31,848
Guy's and St Thomas'	22,188
King's College Hospital	13,291
Lewisham and Greenwich FT	6,888
South London & The Maudsley SLAM (also covers Croydon)	5,526
Oxleas	3,958
Pharmacy (July 22)	2,457
Adult Social Care (Local Authorities)	2,400
General Practice (July 22)	5,065
Bromley Health Care	1100
SEL ICB	663
Figures for independent sector (other than adult SC are unknown), those working for direct payment recipients are also not counted.	unknown
<b>Estimated workforce SEL</b>	<b>132,384</b>

# Local Context

## Our Population: Lambeth and Southwark

- Population 625,300
- High levels of deprivation
- Significant health inequalities
- Challenges with digital literacy
- >150 different languages spoken
- Aging population
- Population set to increase by 5.2% over the next 5 years

# Local context: Lambeth and Southwark

- NHSE target capacity 40-50 virtual ward 'beds' per 100,000 population, achieving 80% occupancy
- 240-300 'virtual beds' in Lambeth and Southwark ICS

## A collaborative place-based approach

- Project governance and assurance structure within the Local Care Partnerships (including primary care, VCS, social services, acute and community care representation) allows us to develop an integrated, holistic VW model taking into consideration the needs of the diverse local populations we serve.
- Engagement with a range of partners including primary/secondary/voluntary/social care providers and commissioners
- Overseen at an SEL level via a Steering group supported by a Community of Practice with representation from all boroughs.

# Lambeth and Southwark Virtual Ward Expansion Plans

Through co-design we are addressing the following:

Domain	Capability
<b>DEMAND AND ACCESS</b>	Assessment of demand and access by ethnicity, Index of Multiple Deprivation, geography and insight to inequality and unmet need
<b>PATIENT ENGAGEMENT AND CO-PRODUCTION</b>	Designing services with patients and communities and involving patients in supporting care delivery
<b>PARTNERSHIPS, LEADERSHIP &amp; WORKFORCE</b>	Partnership working, leadership and workforce skills and roles
<b>MANAGEMENT OF CLINICAL RISK</b>	Supported by integrated Multi-disciplinary team with input from local care partnership providers ensuring appropriate referrals are received for patients who otherwise would have stayed in hospital, not building an additional safety net

# Lambeth and Southwark Virtual Ward Expansion Plans

Phase 1 – Expand current services

Phase 2 – Digital service offer, Remote Monitoring

Phase 3 – Optimise, Scale-up and Integrate

Opportunities	Challenges
<p>New opportunity to develop a coordinated approach to caring for more patients outside of hospital in an environment familiar to them such as their own home.</p>	<p>The term 'Virtual Ward' creates a conceptual challenge – services operate as a hybrid function to allow greater patient flexibility and not fully 'virtually', though that is a tool to be utilised.</p>
<p>Provides an alternative to hospital attendance/admission which does not mean a shift in care but a targeted expansion of capacity to alleviate pressure on the system.</p>	<p>Staffing presents a significant challenge which is driving the implementation of digital solutions.</p>

# Lambeth and Southwark: Virtual Ward Early Development

- Recognition and rebadging of teams and services providing care that aligns with the NHSE definition of virtual wards across a broad spectrum of clinical pathways and provider organisations
- Virtual Ward funding:
  - Increasing capacity of existing face to face services
  - Addressing gaps in access across the geographical population investing in new services
  - Developing a Remote Monitoring technology enable pilot project

# Lambeth and Southwark Virtual Wards Landscape - Adults and Children

St Christopher's	GSTT				KCH
<p><b>Palliative care</b></p> <p>Provide specialist symptom management, advice and end of life care for people with serious illness in South catchment area Southwark and Lambeth.</p> <p><b>TBC- In progress</b></p>	<p><b>Palliative care</b></p> <p>Provide specialist symptom management, advice and end of life care for people with serious illness</p> <p><u>Includes:</u></p> <ul style="list-style-type: none"> <li>- Community palliative care team supporting patients Northern parts Southwark and Lambeth</li> <li>- Overnight Pal@home overnight service (8pm - 8am) for entirety of Southwark and Lambeth.</li> </ul> <p><u>Hours of operation:</u>  <i>VW Palliative care core MDT:</i> Mon-Fri 9-5pm. # ONWARDS REFERRAL

Escalation and requires increase acute care

Ongoing therapeutic & social support

Further medical optimisation

# Progress so far

Since April 2023 we have :

- Delivered a **65%** increase in virtual ward capacity
- Delivered **80%** utilisation against the 80% target set by NHSE
- Supported implementation of Epic across all services
- Progressed pilot project and contract with Doccla using remote monitoring technology
- Additional benefits:
  - Identifying and addressing historical variation in service provision across Lambeth and Southwark (IRT, Palliative Care, Outreach Therapy Services)
  - Building partnerships across organisational boundaries

# Remote Monitoring: Doccla Contract

Contract with Doccla, chosen as remote monitoring provider through competitive tender process using CCS Procurement Framework. Doccla provide the technical platform, devices, customer support to on-board patients and provide on-going tech help as well as clinical monitoring.

Adopted to support the existing @home and IRT service to enable earlier safe and supported discharge from hospital and/or to provide a safe and supported alternative to hospital admission for patients, expanding to additional clinical pathways to increase utilisation in a phased approach

Test and learn from a 1-year pilot project with a 3-month implementation period to address:

- Operational experience of how remote monitoring could be operationalised efficiently
- To discover the challenges, identify the barriers and define the benefit for the patient, the system and clinically.
- Discover what impact RM has on the sustained pressure on urgent and emergency care services and support elective recovery by supporting patients to access clinical monitoring in their own home.

# Technology-enhanced care

Live from mid-July 2023

Through our partnership with Doccla we provide:

- Clinical kit
- Devices to facilitate connectivity
- Customer services: device delivery, onboarding, patient compliance support
- Clinical monitoring and support
- Clinical web portal
- CQC compliance

1

## Identification & Admission

Clinician selects and admits a patient onto the Doccla Virtual Ward. Patient receives devices.

2

## Onboarding & Reporting

At home, the patient is onboarded and uses devices provided by Doccla and the patient app to send clinical data.

3

## Monitoring

Client or Doccla clinicians monitor patients' vital signs, subjective responses and alerts via Doccla web dashboard.

4

## Patient Support

If needed, the clinician can message the patient or hold a video call. They can also adjust patient's alert thresholds.

5

## Discharge

When the monitoring is completed, the patient is "discharged" from the Doccla Virtual Ward and devices are collected by a courier.

# Remote Monitoring Delivery Plan

Pathways	Live Y/N/Paused	Stage	Est. date for go-live
GSTT Hosp @ Home (inc. frailty, respiratory, other)		Live	
GSTT Integrated Respiratory Team (IRT)		Live	
Evelina Children's. (bronch and acute resp)		Live	
Palliative Care (IPoS Questionnaire – GSTT/St Christophers)	Not live	Preparing for go-live	Early March 2024
Hepatology (KCH/GSTT)	Not live	Exploratory	End of March 2024
Heart Failure (KCH/GSTT)	Not live	Preparing for go-live	TBC
Surgery (KCH/GSTT)	Not live	Exploratory	From April 2024
Diabetes, Diabetes/Oncology - blood glucose remote monitoring (KCH/GSTT)	Not live	Exploratory	From April 2024
KCH Integrated respiratory team (IRT)	Not live	Exploratory	From April 2024

# Remote Monitoring challenges

- Referral processes – initially lengthy and inefficient using MS Word form sent via email. Doccla building direct patient referral system (PDS) within the Doccla platform to provide pre-populated demographics and simplified process.
- Improved stock control, logistics and speed of delivery and onboarding by having stock stored at clinical bases
- Engagement from patient and families can be challenging; compliance obs, perceived benefits, declining at point of onboarding and anxiety – time investment is needed at point of referral to define expectations and provide assurance
- Workforce: cultural shift required; perceived benefits, acuity
- Building awareness with referrers to virtual ward services that remote monitoring is available and how it can be accessed is key

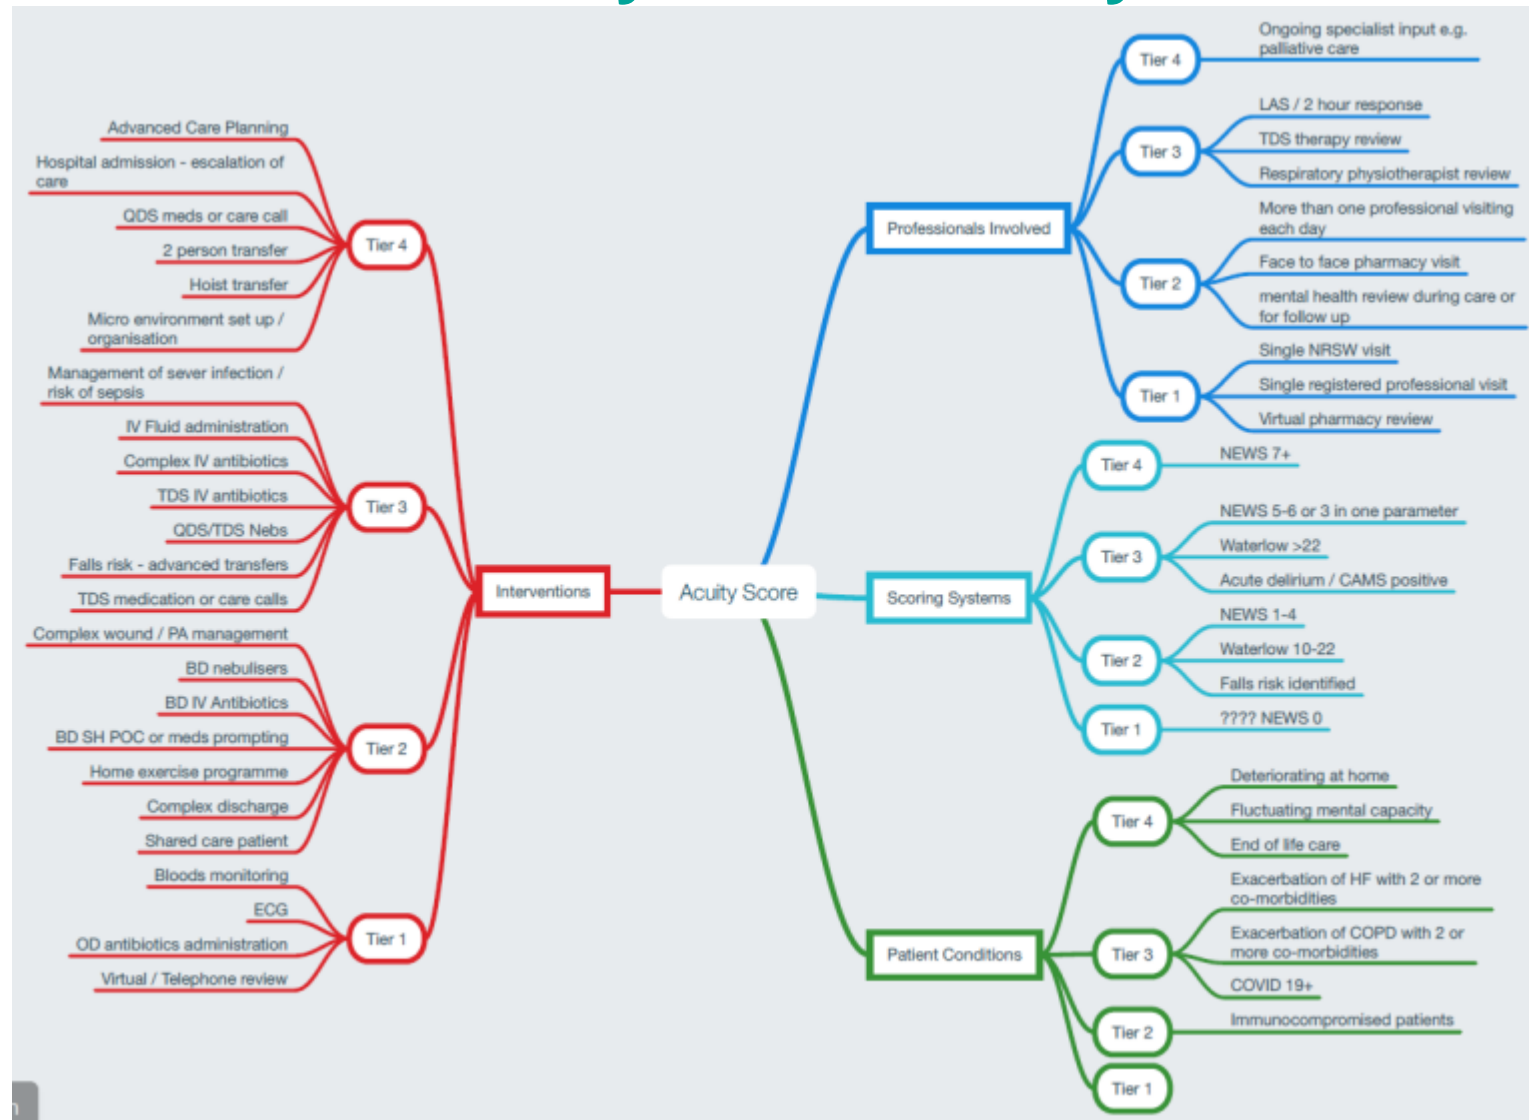

# Remote Monitoring key points of learning

- Identifying patient suitability for remote monitoring: Clinical presentation, Clinical outcome, Social circumstances, Confidence with tech
- Patient conditions and utilisation:
  - 53% Respiratory conditions (COVID, LRTI, CAP, Flu A, exacerbation COPD)
  - 24% Cardiac (Hyper/hypotension, tachycardia, Heart failure)
  - 18% Other (UTI, cellulitis, pain, hyperemesis)
- Exploring potential benefit of moving clinical monitoring in-house
- Anecdotal impact on @Home and IRT activity, and some reduction in system pressures – to be fully defined as part of the evaluation
- Patient activity to be monitored and measured against the GSTT @Home Acuity Tool

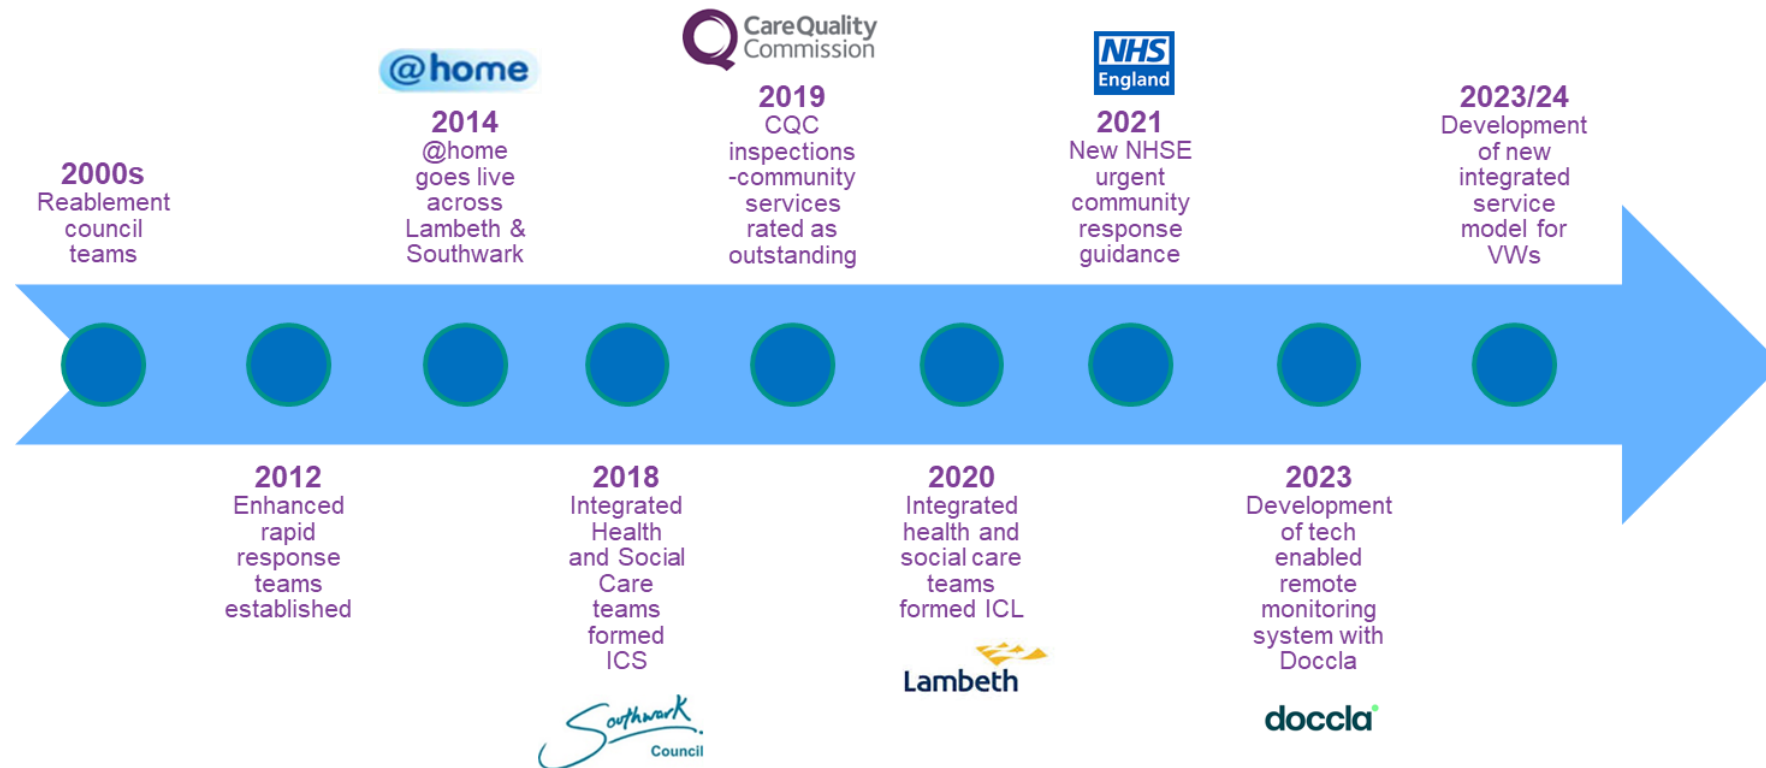

# Case example

- Description** 36yr old lady, had an asthma attack weeks after the birth of her baby. Asthma diagnosed as a teenager, but never prescribed or used medication or experienced any serious symptoms.
- Context**
- Experiencing coughing episodes, wheezing, a tightening chest, and struggling to breathe, finish sentences or lie down.
  - Attended ED and peak flow measured at 100 and condition considered life threatening.
- Methods**
- ED diagnostic testing: diagnosis of asthma attack triggered by rhinovirus, provision of initial management including nebuliser, excluding other pathology e.g. PE
  - Offered referral to GSTT @Home to be managed at home and stay with baby. Patient consented to remote monitoring following triage to monitor heart rate; respiratory rate and peak flow 3 times a day.
  - @home clinicians also visited daily to take blood tests and carry out further checks.
- Outcomes**
- Admission prevented, *“I was glad because I’d rather be at home with my baby and have everything I need around me, especially during the midnight feed.”*
  - Full clinical recovery
  - Husband, who is a self-employed, did not have to take time off work. *“It meant that we still had an income, especially with me being on maternity leave.”*
- What did we learn?**
- Integration of remote monitoring into the @home service enabled this patient, who would have otherwise required hospital admission, to be safely cared for and managed at home
- Patient Experience**
- “I felt so incredibly well looked after. The @home team was absolutely wonderful – the nurses and the doctors. And every person who phoned to check on me was so kind and considerate, and aware of everything. It was such an amazing experience.”*
- “The monitoring is so quick and easy to do. It puts you at ease seeing your results, and knowing you are getting better every day. It made me feel I was a little bit more in control of things.”*

# Virtual Wards Acuity Tool - history

# Virtual Wards Acuity Tool - history

# Virtual Wards Acuity Tool - current

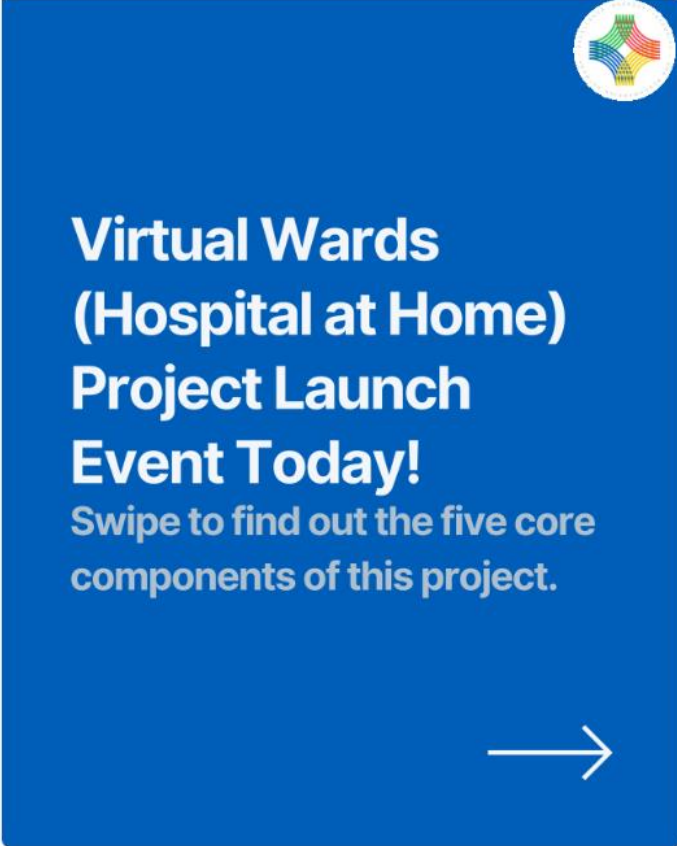

- Based on acuity tool developed in @Home in 2019

Tier 1	Tier 2	Tier 3	Tier 4	Tier 5
<p>Patient does not require any medical or therapy interventions but remains under at home for bridging of care and ongoing social interventions.</p>	<p>Acute care at home. However, patient needs are met through routine once daily typically carried out by band 5 nurse. Low level therapy interventions.</p>	<p>Acute care at home. Patient requires more than a routine visit, clinically stable but at risk of deterioration. This would be typically carried out by senior band 5 and band 6 clinicians, with up to twice daily medical/nursing visits. Therapy input where deterioration is a risk factor.</p>	<p>Acutely unwell at home, clinically unstable with higher risk of deterioration. These visits would typically be carried out by senior Band 6, Band 7 and doctors, with up to 3 visits daily or a joint visit requiring MDT.</p>	<p>Acutely unwell requiring external expertise and staffing level. Patient with an advanced care plan/ceiling of care to be provided in place of residence. These visits would typically be carried out by band 7 clinicians and doctors.</p>

Copyright Guy's and St. Thomas' NHS Foundation Trust 2024

# Virtual Wards Acuity Tool – NHS Benchmarking

- Exciting new project with NHS Benchmarking as part of outcomes from virtual wards.
- Reaching over 230 member organisations.
- Incorporates Experience Measures, Friends and Family Feedback, Clinical Case Review and activity/workforce metrics.

The graphic is a blue rectangular box with a white circular logo in the top right corner. The logo features a stylized cross with four colored arms (green, yellow, red, blue). The text inside the box is white and reads: 'Virtual Wards (Hospital at Home) Project Launch Event Today! Swipe to find out the five core components of this project.' A white arrow points to the right at the bottom right of the box.

# Next steps

- Progress plans to co-design the longer-term vision of integration in our boroughs
- Work with SEL and NHSE colleagues to support reducing variation in virtual ward delivery across the system
- Measure workforce competencies against published guidance and address gaps through a workforce plan
- Interim Evaluation of our pilot scheme for Remote Monitoring
- Scoping opportunity for expanding the remote monitoring offer and integration with Epic
- Working on new opportunities including:
  - People with sickle cell disease experiencing acute crises
  - Expansion of remote monitoring for people with diabetes
  - Delivery of care to people with cancer requiring acute interventions
  - Peri-surgical pathways to release capacity in inpatient areas
  - Home-based interventions for people with chronic liver disease
  - Enhanced care for people with chronic heart failure, including PIFU

# Remote Monitoring Development

SEL ICB has successfully applied to the Health Technology Adoption and Accelerator Fund (HTAAF) for resources to increase the availability of technology enabled virtual wards across the footprint, with a focus on respiratory, frailty and paediatric pathways.

As part of our delivery plan, we will be looking improve utilisation of current capacity and to implement additional clinical pathways

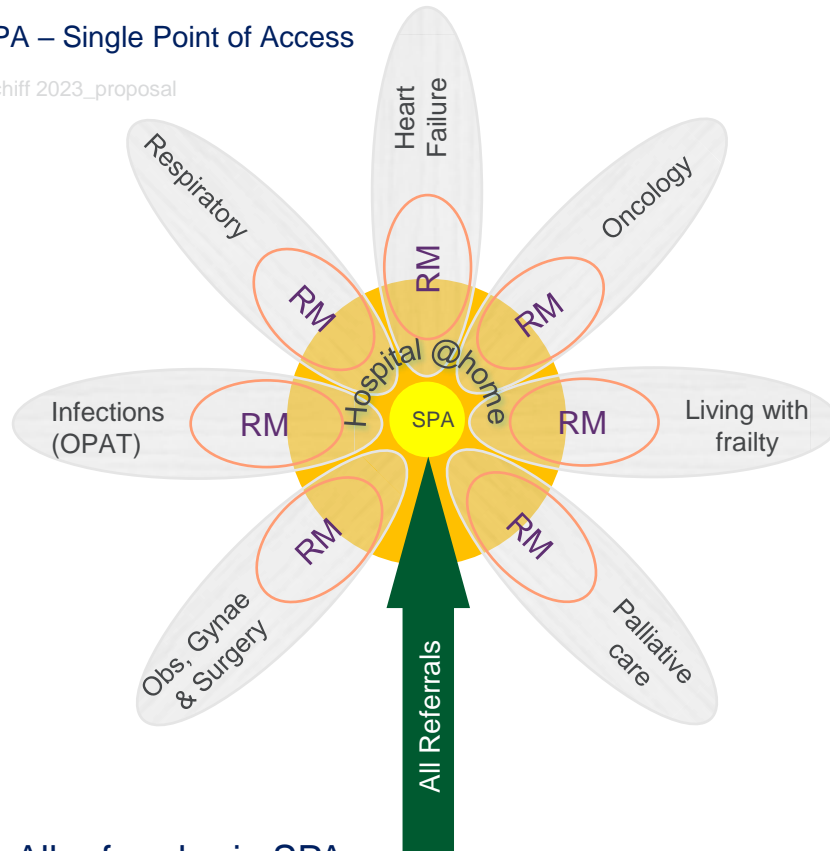

Programme next steps 24/25:

1. Extend the current pilot for a further year or to end of March 2025 to align with other contracts across SEL;
2. Develop Lambeth and Southwark remote clinical monitoring hub;
3. Increase capacity
4. Integration with Epic

# Integrated Virtual wards with Single Point of Access across Lambeth and Southwark

SPA – Single Point of Access

Schiff 2023\_proposal

## Appropriate Level of care

RM	Hybrid	Hospital @home
Virtual monitoring only with ongoing clinical responsibility via relevant specialist team or VM company	Intermittent visits by Hospital @home team and virtual monitoring Clinical responsibility hospital@home with advice from specialist team	At least daily home visits by @home team +/- VM as clinically indicated  Initial UCR within 2 hrs

Increased clinical and functional acuity

Increased in-person visits

- All referrals via SPA
- SPA triage and “admitted” to appropriate level of virtual ward depending on intensity of need.
- UCR via Hospital@home then ongoing care as deemed clinically appropriate via hospital@home, hybrid hospital@home and VM or VM only.
- Patients may move between different levels of virtual ward as clinical picture changes

# Investment in workforce training and development Panel Discussion

Digital Tools that work with your  
care pathway

Lucy Stones

29th February 2023 - The NHS Virtual Ward Conference South.

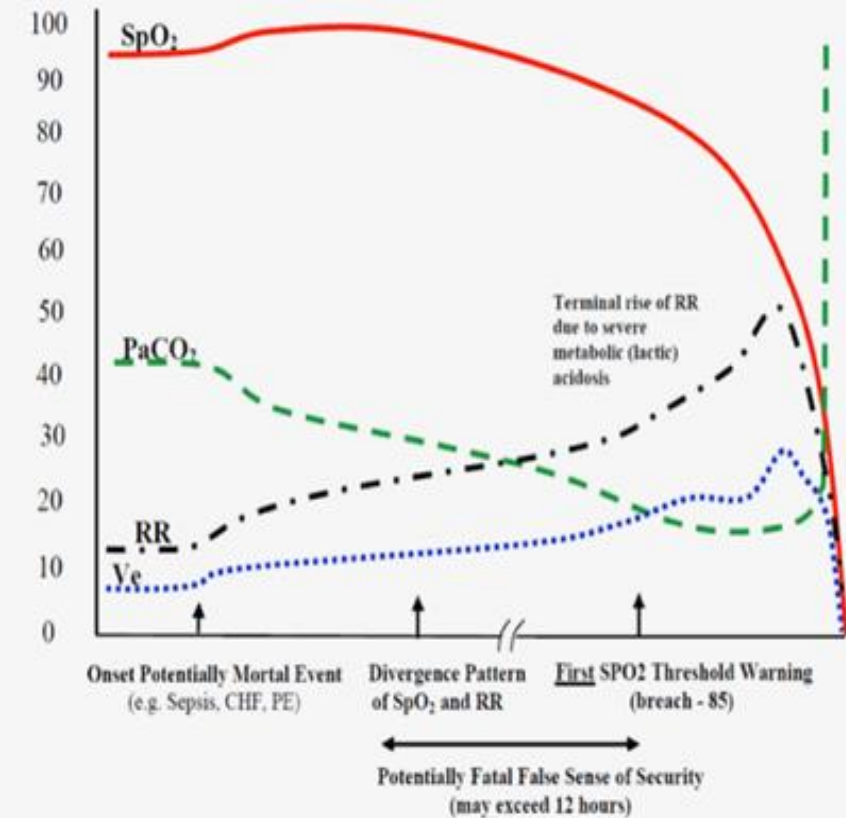

# Patient Story

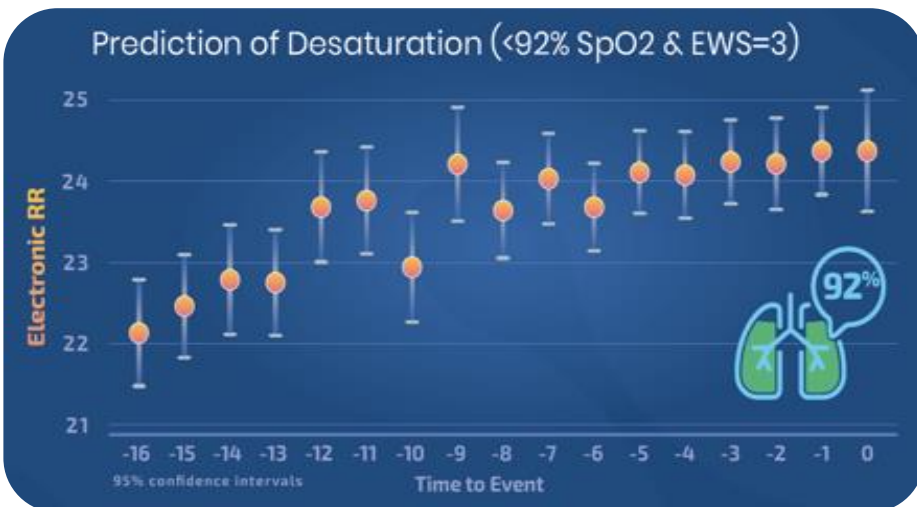

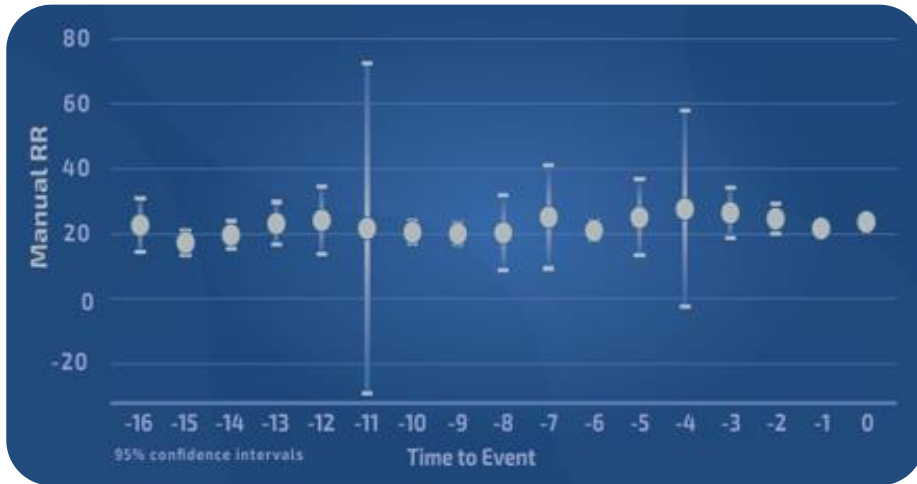

# The Importance of CRR

- Curry 2018 - Changes in respiratory rate indicate potential Respiratory Alkalosis or Metabolic Acidosis
- SpO<sub>2</sub> can be a lagging indicator of same with delayed interventions happening if accurate measurement of elevated RR is not achieved
- Trends versus spot checks for RR give greater sensitivity in correlating abnormal RR with underlined deterioration
- A simple Arterial Blood Gas (ABG) analysis can confirm this in day to day clinical practice.
- Confirmation of Alkalosis or acidosis can give healthcare providers the direction for the appropriate course of treatment.

# cRR prediction of Hypoxia

McCartan2020 demonstrated that eRR >24 breaths per minute gave 12hrs early warning of impending hypoxia event with over 90% sensitivity

Manual RR measurements gave no significant predictive power for pending hypoxia

Electronic monitoring of patients Respiratory Rate can help allocate the Right Resources to the Right Patient at the Right Time

cRR also predicted pyrexemic events of temp>38°C

# What is a Personalised Normal Continuous RR Profile

- Repeating patterns of variation
- Reduction in RR during sleep
- Range of RR is consistent
- Lower and Upper RR averages are consistent

# Example features of cRR to aid in detecting deterioration

## Identify deviations in range, trend or averages from the norm

Example 2: Variation in Lower RR range and trending increase in RR range: occupied with disturbed nocturnal cRR

# RespiraSense – Continuous and motion tolerant eRR monitoring

Single Patient Use RespiraSense Sensor

Reusable/Rechargeable Lobe  
(measures, processes, communicates)

**Optional:**  
Bluetooth SpO2/PR  
monitor - nonin

# The next advance – Continuous Respiratory Rate (cRR)

## Impact

Wellness in COPD tool table/grid

	Stable	Minor	Moderate	Severe	Very Severe	End of Life
Respiratory Rate	12-20	20-24	24-30	30-35	35-40	>40
Saturation	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80
SpO2	95-100	92-95	88-92	85-88	82-85	<80

Deterioration preceded symptoms

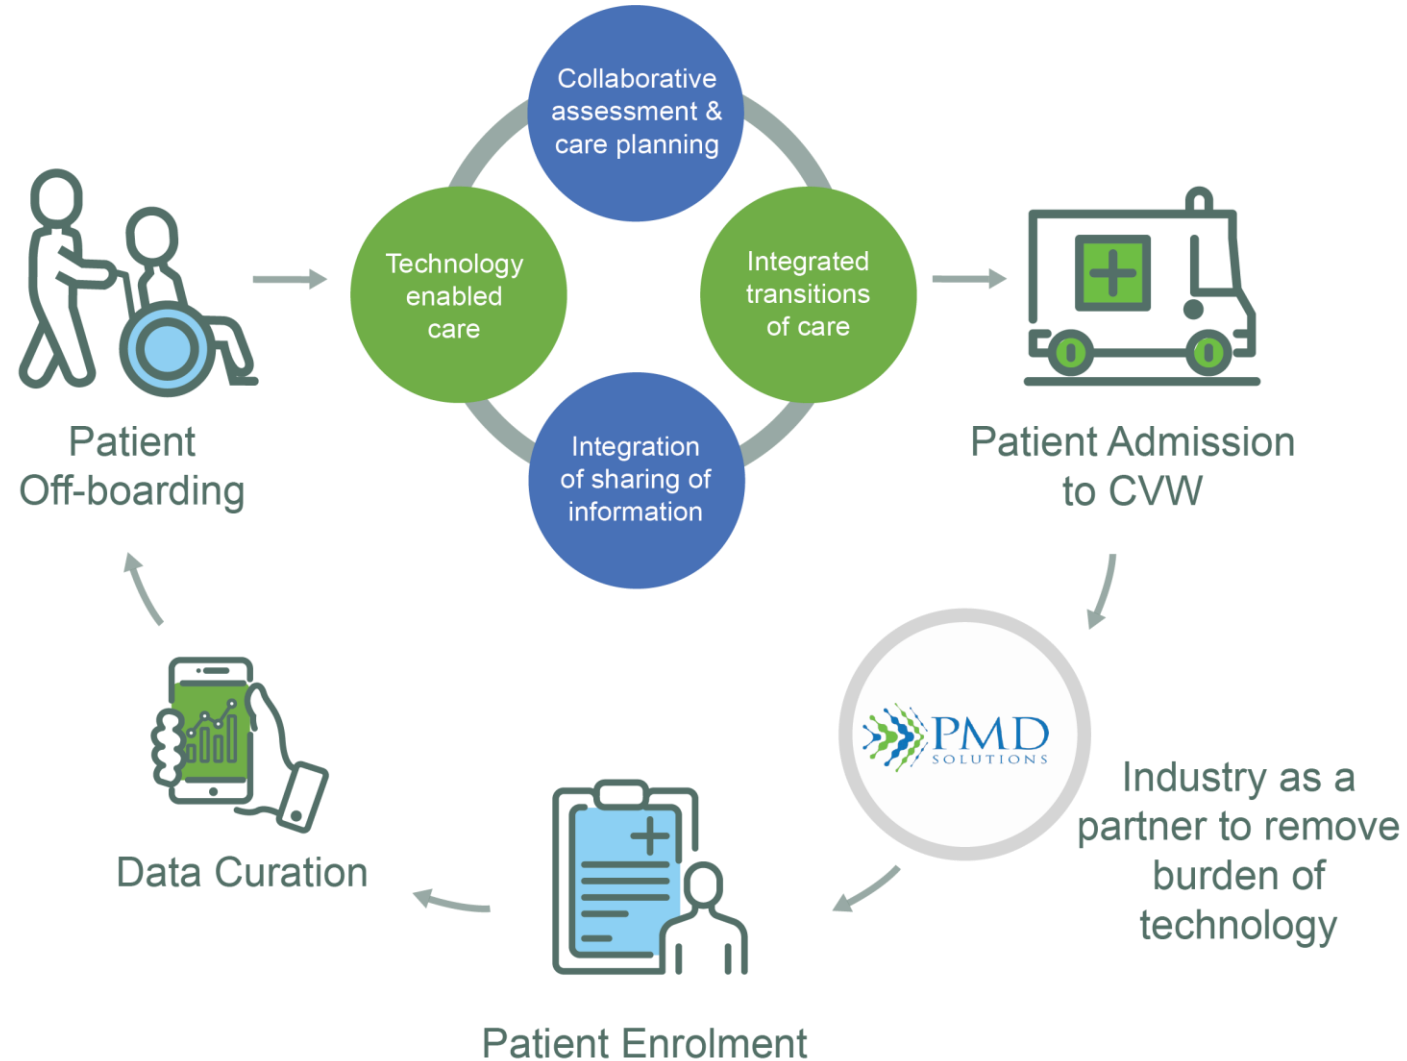

Patient felt intimidated by technology

No improvement in Quality of Life

# Why Change?

# Respiratory Admissions Seasonal Variance South London

## Seasonal Variation of Respiratory complaints has significant impact on Winter Pressures

### Key Correlations:

- Max A&E Waits = 0.85r
- Max Open Beds = 0.905r
- Peak A&E Demand = 0.99r
- Max 12 hr Breaches = 0.905r

# Scaled Impact in South London

## How Respiratory Affects Winter Pressures in South London

- **23%** of all Hospital Admissions in Winter vs. 14% in Summer
- **5,194** admissions pcm
- **1,924** Beds per month (28.5% of beds used vs. 14.2% in Summer)
- **95 A&E** Presentations Per Day

# Admission Profile: NHS England Regions

North West:  
32,907 Admissions  
Free 50 Beds

East of England:  
101,055 Admissions  
Free 305 Beds

N.E. & Yorkshire:  
196,835 Admissions  
Free 155 Beds

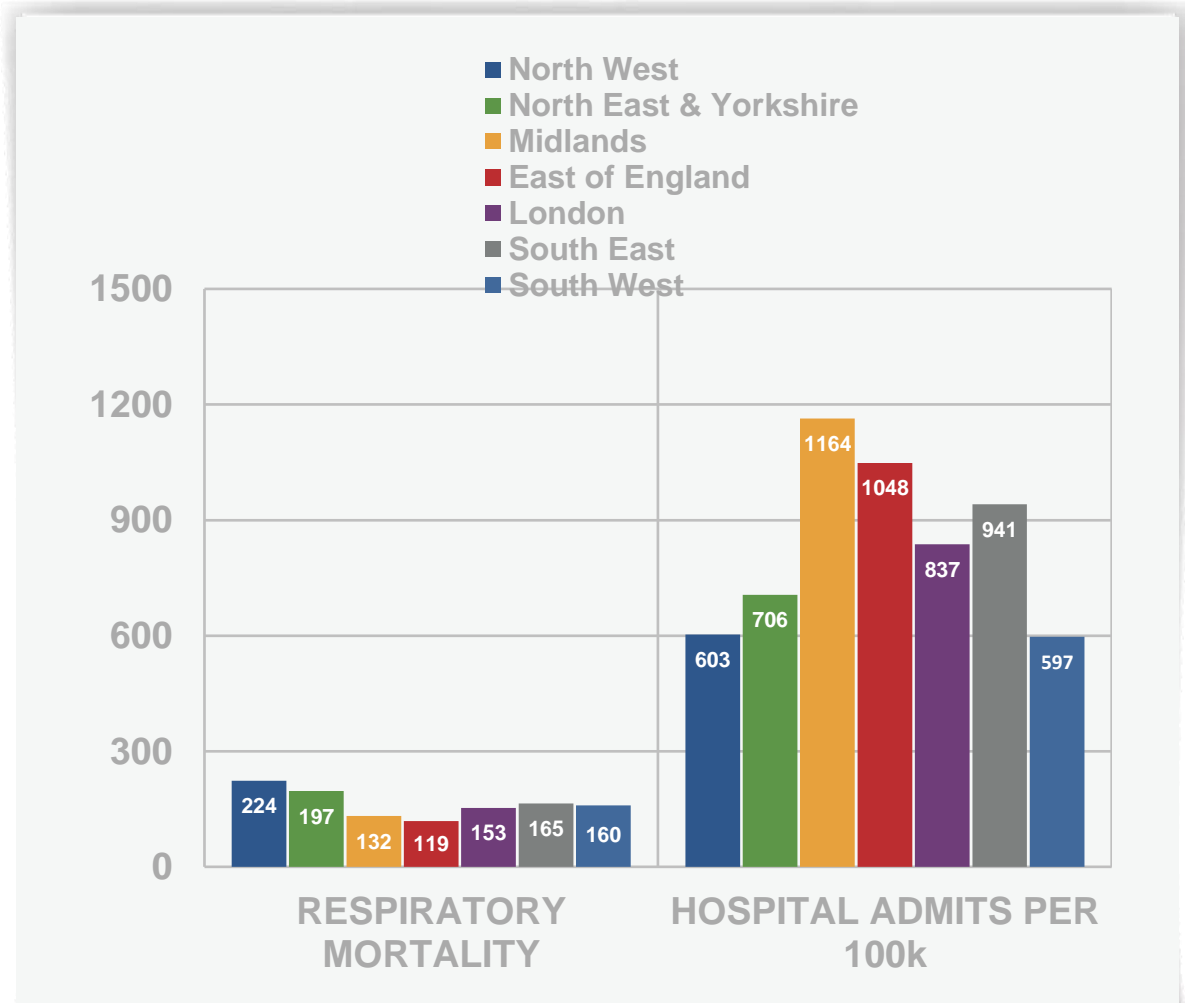

London:  
131,836 Admissions  
Free 722 Beds

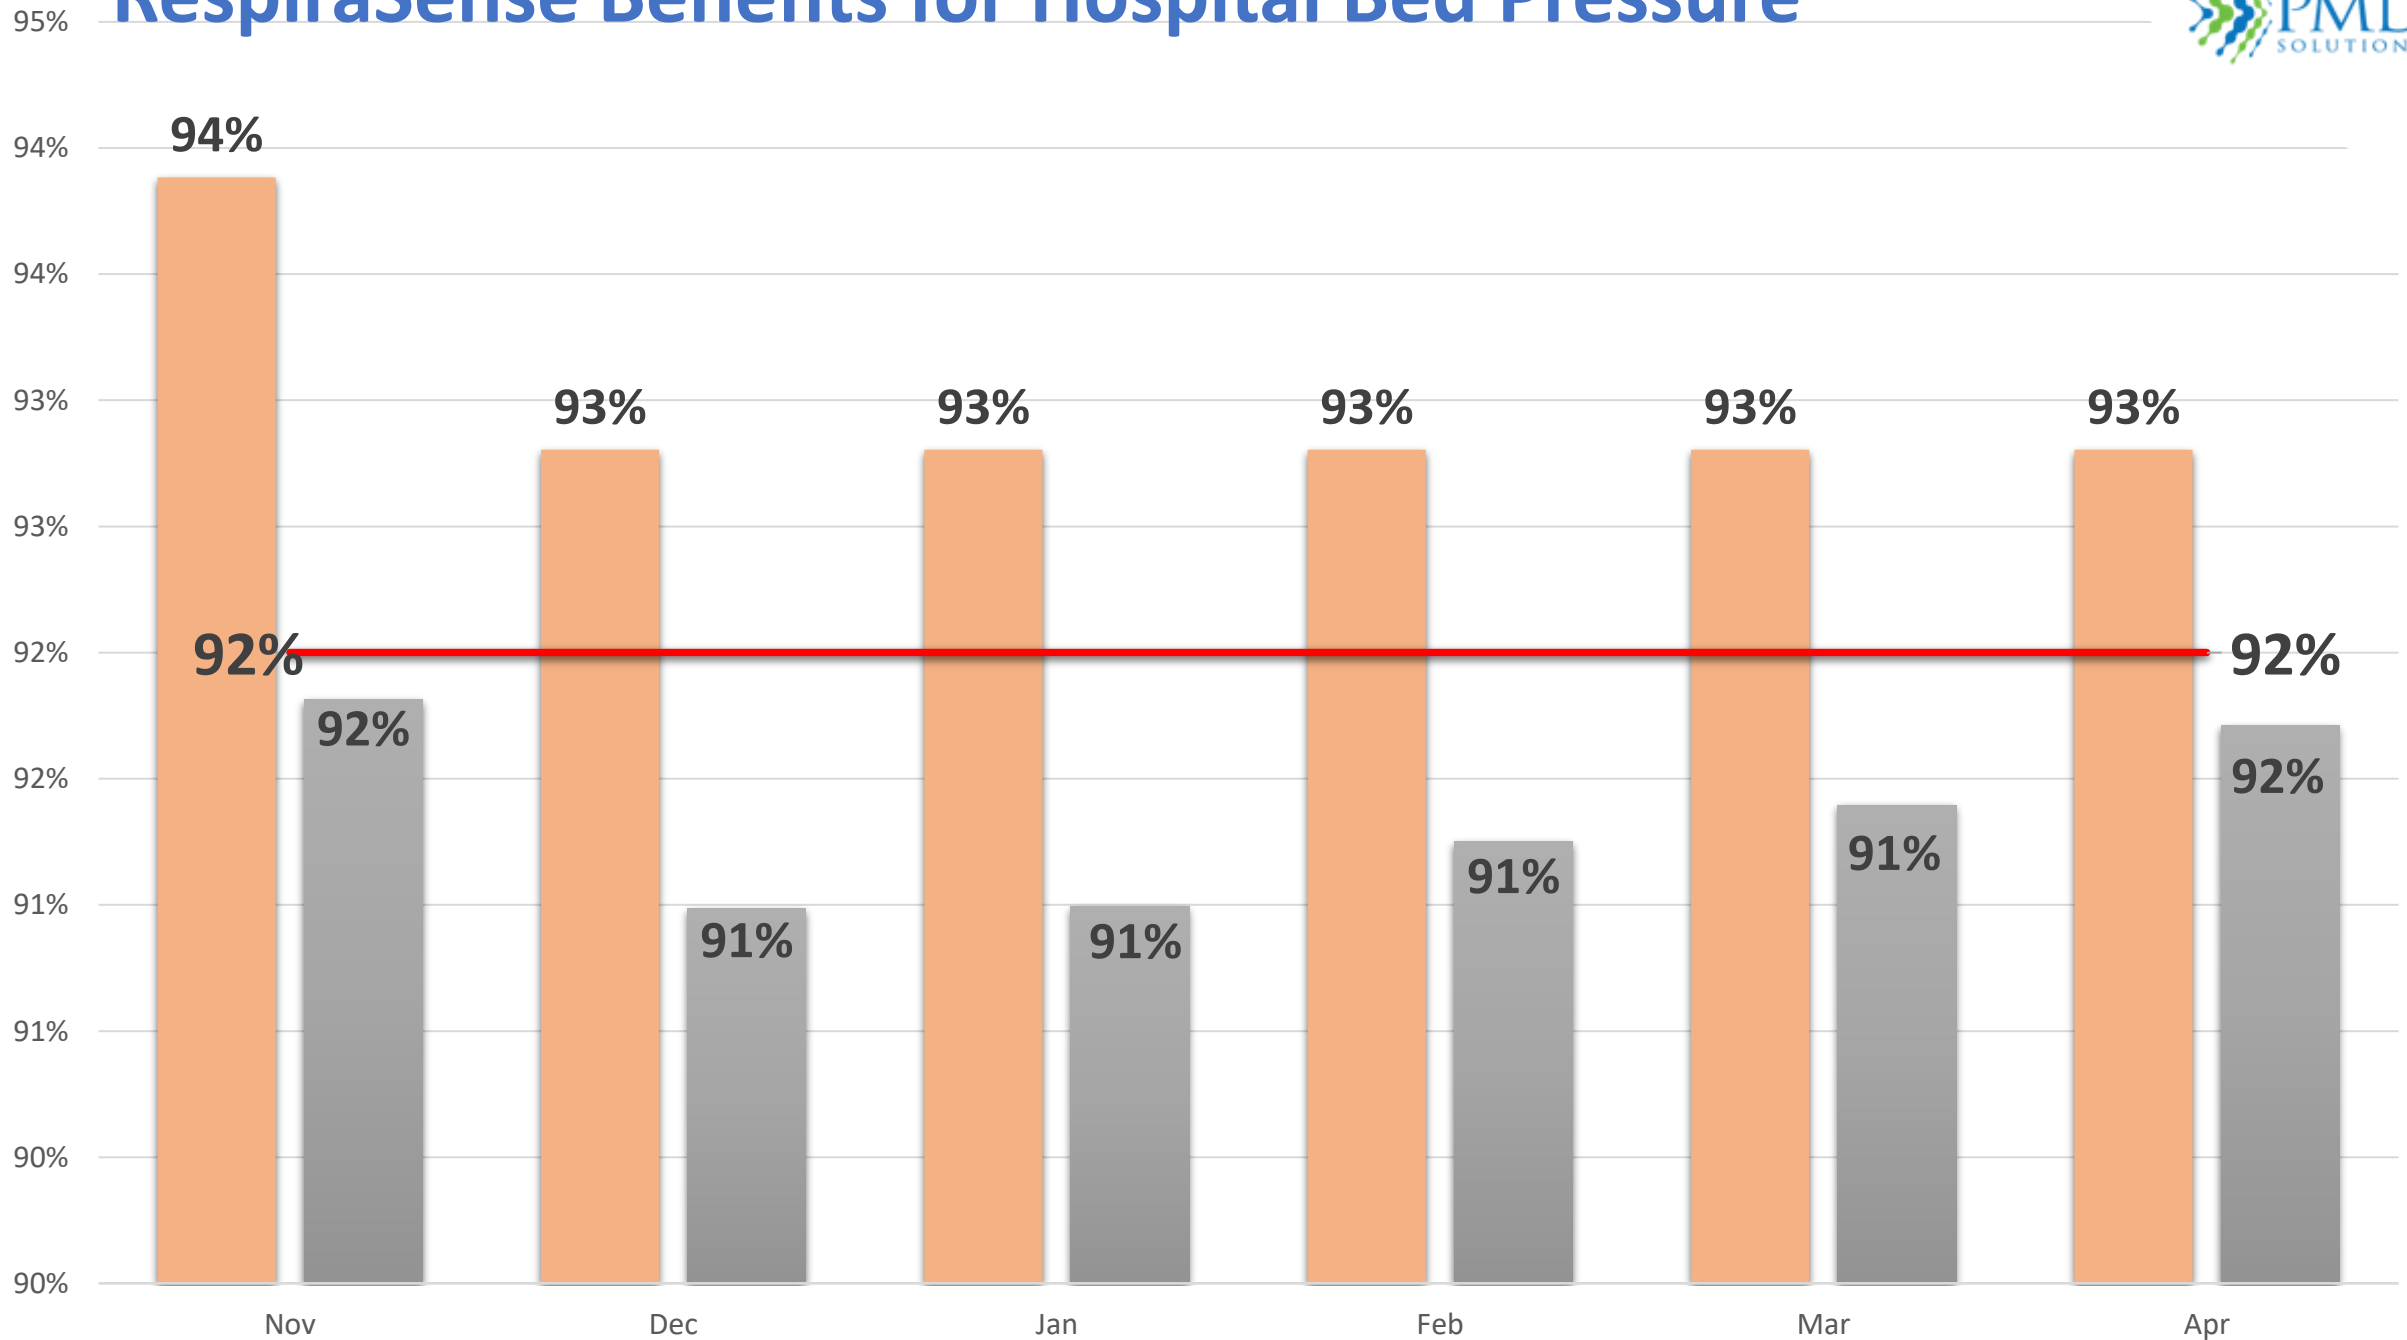

Midlands:  
196,818 Admissions  
Free 155 Beds

South West:  
36,025 Admissions  
Free 52 Beds

# RespiraSense Benefits for Hospital Bed Pressure

## We work across the care continuum ...

**25%**  
Of all social care hours in the UK managed

**500k**  
Community activities referred to by social prescribing link workers

**150k**  
Clinicians use our EPR solution across community and mental health

**80k**  
Individuals protected by Technology Enabled Care

**The right person gets the right care in the right place, based on the right decision made at the right time – all because the person supporting them had the right information when they needed it**

## Improved Outcomes and Control for Individuals

### Transformation

to Person Centric Care delivery model

### Integration

of Tools and Systems

### Data in Context

to enable decision-making

*delivered (home and community)*

*joined up decisions about an individual's*

*information about own health and care*

*Innovation and digitisation to provide tools*

## The future for Care and Healthcare Providers

*Information sharing to establish needs of local populations*

## An overstretched NHS

The NHS is facing significant challenges in coping with increased demand in an environment of declining strategic funding and capacity. This is leading to a multitude of problems across the healthcare system.

### Overburdened healthcare staff and strain on morale

Burn-out caused by mental and physical pressures are leading to greater staff attrition

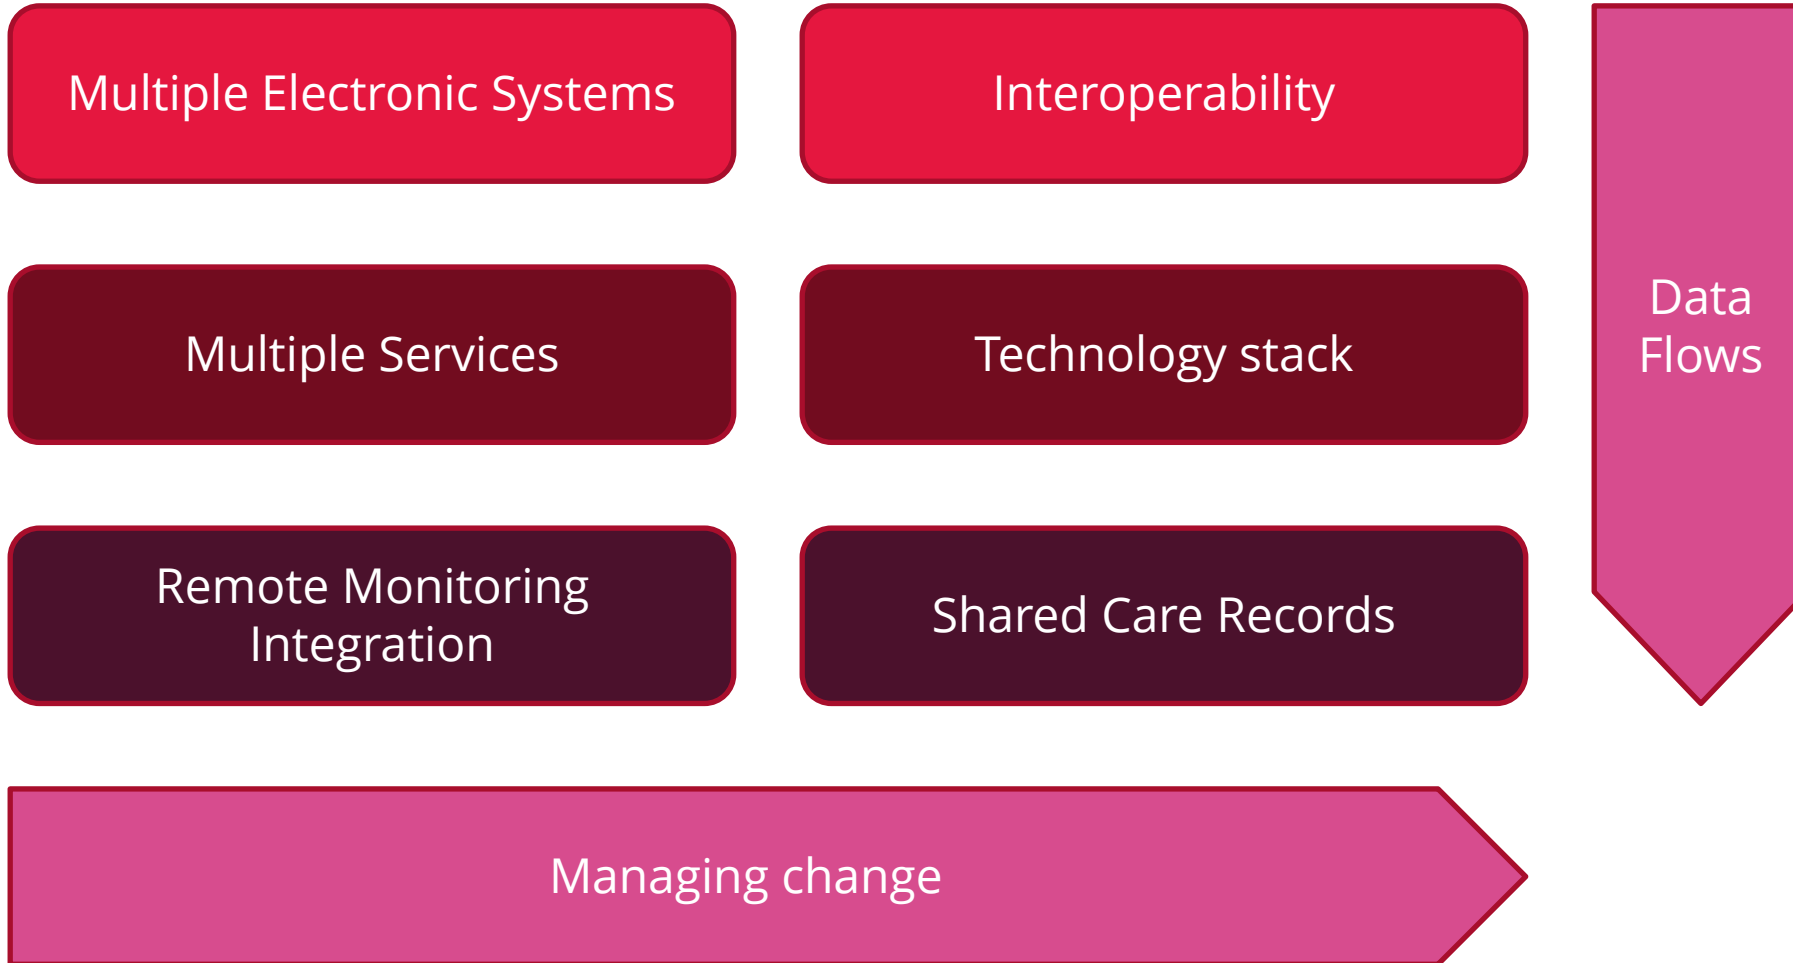

### Breakdown of patient flow and health risks for patients

Patients face delays and a backlog of treatment, resulting in decreased independence and increased health issues

### Excess financial costs for resource-constrained NHS

Rising costs are compounded by "bed blocking" and pressures of an ageing population

## There are many challenges with traditional approaches...

## Integration is the differentiator

We believe that an integrated approach, looking at more than just remote monitoring and working across the ICB, within existing systems, will deliver better outcomes for people, clinicians, organisations and communities.

### Transformation

- Improved access to healthcare in patient's own home
- Reduction in hospital admissions/Admission avoidance
- Enhanced patient experience
- Costs savings

### Integration

- Optimised resource allocation
- Improved Collaboration between Acute and Community services
- Obs scores and NEWS 2 data feeds directly to EPR
- EPR data can be presented on Shared Care Record

### Data in Context

- Proactive care delivery
- Early supported discharge and early detection of complications
- Efficiency in response time by clinicians
- Single data dashboard

# Access Virtual Care: Three core service elements to enable a frictionless clinical experience and unlock the benefits of remote care for individuals

Streamline Processes | Deliver Context Relevant Insights | Improve Outcomes

## 1. Remote Patient Support

Real time data and alerts combining remote clinical observations alongside Activities of Daily Living

Simple, self-administered clinical readings and unobtrusive passive monitoring into EPR, with proactive alerting to changes in behaviour patterns

## 2. Patient Flow and Bed Management

Enable patient RPM data to be accessed in the context of other health record data, and to be incorporated within clinician workflow.

Seamlessly manage patient data and bed availability across both physical and virtual wards

## 3. Transfer and Discharge Management

Simple tools to request and automate the provision of the elements of a patient's clinical assessment or care plan, to enable faster transfer or discharge

## Why is this relevant across health and care...

### Health Providers

- Reduced time spent on bed-related issues / free up beds quicker
- Provide higher-quality care when patients are in the right 'place'
- Focus on providing care rather than administrative logistics (easier discharge)
- Identify health deterioration and deliver timely interventions
- Improved patient outcomes

### Local Authorities

- Link to re-enablement providers
- Joining up systems to help prevent admissions (to care home / hospitals)
- Reduce care home costs
- Delivery of personalised care services
- Collaborative working to deliver co-ordinated care
- Reduce bottlenecks in delivering services

### Care Providers

- Creates new service opportunity
- Better visibility of citizen needs
- Supporting Virtual Care patients at home
- Increase/improve capacity management and efficiency
- Deliver person centred quality care

## What's next?

- More than 15 million people in the UK live with a long-term condition (LTC)
- Existing strategy for identifying and supporting those with long-term illnesses is only half the battle
- Prevent patients from being admitted into hospital or needing costly ongoing treatment in the first place
- Joined-up care model integral in keeping LTC patients from deteriorating
- Unify primary, acute and community services so that patients have improved access to treatment and care
- Virtual care is leading the way in all of this and we at Access will continue to champion its potential to transform the health sector and provide health and care workers with the tools to make a difference

## Integration provides the cooperation needed to make virtual wards a success

1. Rather than putting in a short-term tactical solution, look at how to create **smoother, clearer workflows** between Acute, Community and Social Care to support someone at home
2. Deploy **interoperable software solutions** that allow those providing care to use systems they are familiar with, while enabling them to share information to support virtual ward workflows
3. Use systems that staff recognise and understand, and integrate them so information is available when needed, also **reduces the burden on those providing care**

## **Consider technology that promotes:**

- **Admission avoidance**
- **Frictionless processes**
- **Optimised data flows**
- **Prevention of delays to discharge or transfer**
- **Putting people first, both citizens and frontline staff**

Helping all of us to enjoy longer, healthier lives, with greater independence, in our chosen place, by providing sustainable, safe and high-quality integrated health, support and care

**The freedom to make it personal**

## Journey on the Virtual Ward (Pathways 1, 2, 3)

Admission Avoidance (Step-Up): Pathway 1 - AA from Gateway (ED/CDU/SDEC/AAU/AMU) & Pathway 2 - AA from Community // Early Supported Discharge (Step-Down): Pathway 3

Our patients are in need of care on the virtual ward.

This results in our Trust needing to have a process in place, to provide them with care.

Therefore, our operations must establish a clear approach to ensure they receive the care they need.

Referral is processed by the UCR team.	Patient referral is accepted for VW and they are admitted/onboarded to the service.	Patient is discharged from the acute to their home. (This step applies to patients on Pathway 3.)	Patient is assessed and a care plan is created (includes medicines reconciliation).	A prescription is required for the patient at the start of their care.	Remote monitoring is required for the patient.
--	---	---	---	--	--

The patient waits for their referral to be processed.	The patient is admitted and onboarded to VW.	The patient is discharged to their home.	The patient is assessed and their care plan is developed.	The patient requires an initial prescription.	The patient requires remote monitoring.
<i>'For those last couple of days I was in the hospital, I was just itching to get home. If I had known sooner about it [VW], then I could have said: hey, why can't I make use of this service?'</i>	<i>I was happy to be going home, but very unsure of the [VW] service.'</i>	<i>'It was nice that they discharged me from the hospital and I could be treated at home. And I really do believe it actually speeded up my recovery process, because it made me feel more positive.'</i>	<i>'I [carer] just got told that it [VW] is going to be an ongoing thing. That he [the patient] is going to need carers. But we didn't really get a care plan as such.'</i>	<i>The hospital started me on a new medication and the respiratory nurses tried to get it from the doctor. Apparently it wasn't sent up. I had to phone them, but I eventually got it.'</i>	<i>This is like you're having 24-hour care at home with a machine, it's absolutely ideal!</i>
Clinical conversation with SCDM. If the referral is rejected, a call is made to the referring clinician in the acute to add this to the patient's notes.	Patient is told that they have been accepted to the VW and that they will be discharged to their home (P3)		Perform initial assessment of patient. // Pharmacist attends daily board rounds.	The patient, their next of kin, or their carer collect medicine from a community pharmacy. // The Core VW Team collect medicine from a pharmacy (acute or community) or VW stock.	The Core VW Team perform a clinical visit to support the patient set up the equipment.
			Daily board round - discuss patient care plan under VW. Done in-person or remotely (MS Teams).		Daily board round - discuss remote monitoring. Done in-person or remotely (MS Teams).
UCR receives referral via phone call// Clinical conversation with SCDM.	Patient is told that they have been accepted to the VW and an ANP will visit them in their home. (P1 & P2) // GP is informed that patient has been admitted to VW.	Patient is told that an ANP will visit them in their home, and the approximate time they will be there. (P3)	Pharmacist will call the patient or their carer to understand their drug history.	Phone consultation with a VW pharmacist or doctor to help explain new or complex medication to the patient.	The Core VW Team call to set up the equipment.
UCR receives referral via email.	Discharge summary/SBAR from other PAS (not S1) to be sent to the VW team, if applicable. (P2) // GP is informed that patient has been admitted to VW.				
			Specialist nurse/ANP understand patients capability to use the VW equipment, if applicable.* (P2)		Patient receives equipment. // Patient is monitored via the equipment. //Core VW Team monitor the caseload via the dashboard.
UCR receives S1-to-S1 referral (P1 & P2) // Search NHS number, add patient to system (if necessary), complete SBAR template, accept or reject referral, and record reasoning.	S1 used to manage referrals and allocated patient to respective caseload(s). // S1 used to open any parallel admissions, if necessary. (P2)	Discharge summary is generated in S1 and sent as a letter to the patient's GP (P3)	Create the care plan. // S1-to-S1 referral to the VW Pharmacy. // Pharmacist undertakes medicine reconciliation and assessment on S1.		Patient health data from Current Health can be copied across into S1, if necessary.
	Patient discharged from Nervecentre (acute) and registered again in community. (ESHT - P1 & 3) // Discharge also written in patient notes and generated.	A paper copy of the discharge letter is		EMIS web prescription (EPMA). // Community MAR sheet completed on paper and	

# How to design the ideal Virtual Ward

1. **Patient experience** – deliver the promise
2. **Align the team** – create a clear understanding
3. **Clinician buy-in** – define how to provide assurance
4. **Business case** – identify specific in-journey metrics
5. **Lead IT** – journey defines use cases, data flows and integration

# How to design the ideal Virtual Ward

**Entry to Virtual Ward (Admission Avoidance - Pathways 1 & 2)**  
This flowchart details the process of admission avoidance. It starts with a patient being identified as at risk of admission. Key steps include: 1. Identification of at-risk patients, 2. Assessment of patient needs and risks, 3. Development of a care plan, 4. Implementation of care plan, and 5. Review and evaluation. The flowchart is organized into a grid with columns for 'Patient', 'Staff', and 'System' across various stages.

**Entry to Virtual Ward (Early Supported Discharge - Pathway 3)**  
This flowchart details the process of early supported discharge. It starts with a patient being identified as eligible for early discharge. Key steps include: 1. Identification of eligible patients, 2. Assessment of patient needs and risks, 3. Development of a care plan, 4. Implementation of care plan, and 5. Review and evaluation. The flowchart is organized into a grid with columns for 'Patient', 'Staff', and 'System' across various stages.

**Journey on the Virtual Ward (Pathways 1, 2, 3)**  
This large flowchart details the patient's journey on the virtual ward. It starts with the patient being admitted to the virtual ward. Key steps include: 1. Admission to the virtual ward, 2. Assessment of patient needs and risks, 3. Development of a care plan, 4. Implementation of care plan, 5. Review and evaluation, and 6. Discharge from the virtual ward. The flowchart is organized into a grid with columns for 'Patient', 'Staff', and 'System' across various stages.

**Discharge From the Virtual Ward (Pathways 1, 2, 3)**  
This flowchart details the process of discharge from the virtual ward. It starts with a patient being identified as ready for discharge. Key steps include: 1. Identification of patients ready for discharge, 2. Assessment of patient needs and risks, 3. Development of a care plan, 4. Implementation of care plan, and 5. Review and evaluation. The flowchart is organized into a grid with columns for 'Patient', 'Staff', and 'System' across various stages.

Description (Read First)		A 'to-be' or 'future-state' user journey is a visual diagram that acts as a detailed representation of how a future service should work.		
Journey Name		<b>Entry to Virtual Ward (Admission Avoidance - Pathways 1 &amp; 2)</b>		
Pathway Affected		Admission Avoidance (Step-Up) Pathway 1 - AA from Gateway (ED/CCU/SECC/A&U/AMU) & Pathway 2 - AA from Community		
Journey Summary		Our patients are in need of care that can be delivered through a virtual ward approach, as opposed to being accepted onto a physical ward. This results in our Trust needing to refer them into the service, so they can provide them with care. Therefore, our operations must have a process in place to refer patients on Admission Avoidance pathways (1 AA from Gateway & 2 AA from Community).		
Journey Steps		<p>Patient is identified by the Community (Pathway 1) or via the Gateway (Pathway 2) as eligible for Virtual Wards. (P1)</p> 	<p>Patient is assessed during the visit and their consent is requested for VW if they are eligible. (P2)</p> 	<p>Patient is referred to the VW.</p> 
Patient Activity		The patient is visited at home by a specialist nurse or an ANP (P2) [S]. The patient is identified as the Gateway, once they are seen by clinicians. (P1)	The patient is assessed for VW by the community specialist or the ANP and consent is requested. (P2)	The patient is referred to the VW and remains at home.
Patient Verbatim		"I asked for months and months if there was any way I could have my [W] (admission) at home, so I could be at home for my family."	"I just said I'd like to join [VW] I was happy to receive the news."	"I don't know what I would've done if this service [VW] wasn't here. I needed to be at home for my kids."

<b>Description</b>	The user journey name.
	The patient pathway that is affected.
	A summary of what this journey is showing. It describes the User Story (i.e., what's the problem), then the Business Story (i.e., why it matters) and concludes with the Operational Story (i.e., what we must do).

The 'to-be' journey steps.

An illustration of each step of the user journey. This helps everyone understand what the user experience would look like.

The high-level patient activities (step-by-step).

Representative quotes from patients - to maintain their experience. These come from the research conducted with them.

The relevant channel(s) to this journey are shown in light blue. A note explains their role and the user interactions that take place.

Frontstage activities are those that are patient-facing. They describe what would happen at a high-level, step-by-step, including the roles or teams involved. Each journey step can have one or more activities underneath it. Any future steps are highlighted in a different colour to stand out.

A user story is an explanation of a service feature, written from the perspective of the user. It is typically written in the format: 'As a... I want... so that...'. The purpose of a user story is to articulate how a change will deliver a particular value back to the user.

Backstage activities are those that the patient doesn't see. They describe what would happen at a high-level, step-by-step, including the roles or teams involved. Each journey step can have one or more activities underneath it. Any future steps are highlighted in a different colour to stand out.

A user story is an explanation of a service feature, written from the perspective of the user. It is typically written in the format: 'As a... I want... so that...'. The purpose of a user story is to articulate how a change will deliver a particular value back to the user.

Business goals are the milestones for the future user experience. They are written as a measurable, achievable action or state.

A metric is a guideline that is used over time to encourage good/reflective behaviours. This is usually done using quantifiable measures (time, cost, etc.). Key metrics help illustrate the success of the future user experience.

# How to design the ideal Virtual Ward

## 1. Patient experience

## 4. Measure and prove

## 5. Lead IT

<b>Description (Read First)</b>		A 'to-be' or 'future-state' user journey is a visual diagram that acts as a detailed representation of how a future service should work.		
<b>Journey Name</b>		<b>Entry to Virtual Ward (Admission Avoidance - Pathways 1 &amp; 2)</b>		
<b>Pathway Affected</b>		<b>Admission Avoidance (Step-Up) Pathway 1 - AA from Gateway (ED/ICU/SDCC/A&amp;U/AMU) &amp; Pathway 2 - AA from Community</b>		
<b>Journey Summary</b>		Our patients are in need of care that can be delivered through a virtual ward approach, as opposed to being accepted onto a physical ward. This results in our Trust needing to refer them into the service, so they can provide them with care. Therefore, our operations must have a process in place to refer patients on Admission Avoidance pathways (1 AA from Gateway & 2 AA from Community).		
<b>Journey Steps</b>		Patient is identified by the Community (Pathway 1) or via the Gateway (Pathway 2) as eligible for Virtual Wards. (P1)	Patient is assessed during the visit and their consent is requested for VW if they are eligible. (P2)	Patient is referred to the VW.
<b>Patient Activity</b>		The patient is visited at home by a specialist nurse or an ANP (P2) (S) The patient is identified via the Gateway, once they are seen by clinicians. (P1)	The patient is assessed for VW by the community specialist or the ANP and consent is requested. (P2)	The patient is referred to the VW and remains at home.
<b>Patient Verbatim</b>		"I asked for months and months if there was any way I could have my VW administered at home, so I could be at home for my family."	"I just said I'd like to join [VW] I was happy to receive the news."	"I don't know what I would've done if this service [VW] wasn't here. I needed to be at home for my kids."
<b>Key Channels</b>		Face-to-Face: Specialist nurse or ANP sees patient. (P2) if ED/ICU/AMU/A&U/SDCC see the patient. (P1)	Face-to-Face: Patient is assessed by specialist nurse/ANP. Clinician-to-clinician discussion to check VW capacity. (P2)	Face-to-Face: Specialist nurse/ANP make a telephone referral - this goes to the UCR in both the SCFT and EBHT. (P2)
		Phone	Clinician-to-clinician discussion to check VW capacity. (P2)	Specialist nurse/ANP make a telephone referral - this goes to the UCR in both the SCFT and EBHT. (P2)
		Paper	Informed consent is given by the patient or their carer, and they are given an informational leaflet. (P2)	
		SystemOne		S1 to S1 referral to Community VW Team, followed up with a phone call (Pathway 2 - SCFT).
		Other	Video conference between specialist nurse/ANP/SCDM and patient (if necessary). (P2) Patient's verbal consent is recorded and stored in the medical notes, scanned onto SystemOne/Evolve. (P1)	The referral can also be done over MS Teams and is typically recorded SCFT1.
<b>Frontstage Activities (Includes Future Activities)</b>		The patient is visited at home by a Community Specialty Team or an ANP as part of their existing care plan. This will usually be a regular visit, as VW don't accept patients that are unknown to the service. (P2)	Initial holistic assessment of patient is carried out by the specialist nurse or ANP. This is done as part of the usual community rounds for new and existing patients. (P2)	The patient is informed that they have been referred to the Virtual Ward, with the expected next steps.
		If a patient is identified and referred via the Gateway, e.g. by SECAMb, the UCR will go out and do a holistic assessment of the patient. The patient will be asked for consent before being put on the VW caseload. (P1)	Patients that don't fall into the three specialities - heart failure, respiratory, frailty - would be eligible for the Core Ward.	
		Patients that don't fall into the three specialities - heart failure, respiratory, frailty - would be eligible for the Core Ward.		
		Most patients with long-term conditions may be under one of the three specialities - heart failure, respiratory, frailty. (Speciality Ward)	"If applicable, the patient's capability to use any equipment is assessed. Not every patient will need this, only those with monitoring needs - e.g. heart failure patients observations will be done face-to-face.	
		When the patient is identified as eligible for VW in the community or via the Gateway (P1), they are able to have a conversation with the appropriate clinician about their care - to indicate their care preferences.	When the patient is identified as eligible for VW via the Community (P2), they are able to have a conversation with the appropriate clinician about their care - to indicate their care preferences.	
<b>User Stories</b>		As a patient, I want clinicians to respond to any preference or request for care provided in my home, so that my care takes place in the most appropriate setting and in the most appropriate way for me.	As a patient, I want clinicians to respond to any preference or request for care provided in my home, so that my care takes place in the most appropriate setting and in the most appropriate way for me.	A user story is an explanation of a service feature, written from the perspective of the user. It is typically written in the format: 'As a... I want... so that...'. The purpose of a user story is to articulate how a change will deliver a particular value back to the user.
<b>Backstage Activities (Includes Future Activities)</b>		If a patient is referred via the Gateway (e.g. AMU and the UCR has done an assessment, it will be determined with the help of advanced clinicians whether the patient needs further monitoring. If they do, then they will be put onto the VW caseload. (P1)	Discussion between specialist nurse/ANP and SCDM to decide whether to refer the patient (with their or carer's consent). This could include a virtual consultation between the specialist nurse/ANP, SCDM, and the patient. (P2)	Specialist nurse/ANP contacts the VW directly to make a referral by phone. SCFT and EBHT will have a dedicated/phone number for VW referrals that is managed by the UCR. SCFT can also refer patients to the UCR via a S1-to-S1 referral.
		If a patient is admitted via the Gateway, the referring clinician will need to get the patient's consent. (P1)	Clinician-to-clinician (specialist nurse/ANP and SCDM) discussion to check core capacity for the VW. (P2)	Any social support is kept open in parallel.
		Clinical lead is able to advise whether the patient is a good fit for VW or another service - e.g. High or UCR (P1)	All referrals admission avoidance referrals are sent electronically to S1, to automatically load data and save time from email or phone referrals.	Backstage activities are those that the patient doesn't see. They describe what would happen at a high-level, step-by-step, including the roles or teams involved. Each journey step can have one or more activities underneath it. Any future steps are highlighted in a different colour to stand out.
<b>User Stories</b>		As a clinician, I want to be able to get consent from patients before admission on VW, so that I can record consent and ensure clinical governance for patient care is in place. (1, 5)	As a clinician, I want to be able to get consent from patients before admission on VW, so that I can record consent and ensure clinical governance for patient care is in place. **Entry to Virtual Ward (Admission Avoidance - Pathways 1 & 2)**

This infographic details the admission avoidance pathways for Virtual Wards. It includes a flowchart at the top showing the process from patient identification to admission avoidance. Below the flowchart, there are several tables and sections providing detailed information on the following topics:

- Admission Avoidance:** A table detailing the criteria and processes for avoiding hospital admission.
- Virtual Ward:** A table describing the Virtual Ward service, including its purpose and components.
- Virtual Ward Team:** A table listing the roles and responsibilities of the team members involved in the service.
- Virtual Ward Outcomes:** A table detailing the expected outcomes and benefits of the service.

**Entry to Virtual Ward (Early Supported Discharge - Pathway 3)**

This infographic details the early supported discharge pathway for Virtual Wards. It includes a flowchart at the top showing the process from patient identification to early supported discharge. Below the flowchart, there are several tables and sections providing detailed information on the following topics:

- Early Supported Discharge:** A table detailing the criteria and processes for early supported discharge.
- Virtual Ward:** A table describing the Virtual Ward service, including its purpose and components.
- Virtual Ward Team:** A table listing the roles and responsibilities of the team members involved in the service.
- Virtual Ward Outcomes:** A table detailing the expected outcomes and benefits of the service.

**Journey on the Virtual Ward (Pathways 1, 2, 3)**

This large infographic provides a comprehensive overview of the patient journey on the Virtual Ward across all three pathways. It features a central flowchart at the top illustrating the overall process. Below this, the infographic is organized into a grid of sections, each detailing a specific stage of the journey:

- Admission Avoidance:** Detailed information on the criteria and processes for avoiding hospital admission.
- Early Supported Discharge:** Detailed information on the criteria and processes for early supported discharge.
- Virtual Ward:** Detailed information on the Virtual Ward service, including its purpose, components, and team.
- Virtual Ward Outcomes:** Detailed information on the expected outcomes and benefits of the service.

**Discharge From the Virtual Ward (Pathways 1, 2, 3)**

This infographic details the discharge pathways for Virtual Wards. It includes a flowchart at the top showing the process from patient identification to discharge. Below the flowchart, there are several tables and sections providing detailed information on the following topics:

- Discharge:** A table detailing the criteria and processes for discharge from the Virtual Ward.
- Virtual Ward:** A table describing the Virtual Ward service, including its purpose and components.
- Virtual Ward Team:** A table listing the roles and responsibilities of the team members involved in the service.
- Virtual Ward Outcomes:** A table detailing the expected outcomes and benefits of the service.

## Discharge From the Virtual Ward (Pathways 1, 2, 3)

Admission Avoidance (Step-Up): Pathway 1 - AA from Gateway (ED/CDU/SDEC/AAU/AMU) & Pathway 2 - AA from Community // Early Supported Discharge (Step-Down): Pathway 3

Our patients are on a virtual ward and need to be discharged from the service, either to their home or to ongoing care.

This results in our Trust needing to have a discharge process in place for them, as they no longer need care provided directly by the virtual ward.

Therefore, our operations must establish a clear approach to ensure they are able to leave the virtual ward - regardless of the pathway that they have entered with (1, 2, or 3).

Patient has further health needs and does require hospital attendance.	Patient has further health needs, but does not require hospital attendance.	Patient is clinically ready for discharge from VW.	Discharge patient from the VW.
--	---	--	--------------------------------

The patient is not stable and needs acute care.	The patient is not stable and has ongoing needs.	The patient is stable and ready to be discharged.	The patient is discharged off the VW.
<i>'They weren't happy with my oxygen levels, so they ordered an ambulance to take me down [to hospital]. They wanted me to go back in again.'</i>	<i>'The Virtual Ward told me that when the care would finish, that I would be handed over to the district nurses. They would have all of the information. And that would start the new regime of getting my leg better.'</i>	<i>'Nobody's gonna be calling now? I don't know what's going to happen. You're taking this thing [Current Health] away from me? Am I gonna be okay?'</i>	<i>'I did have a call with my GP the other day. It was a video call that he had requested. I spoke to him and it was quite handy to discuss things.'</i>
Patient is visited by VW clinician to assess care needs. // Clinician-to-clinician discussion around care needs.	Patient is visited by VW clinician to assess care needs. // Clinician-to-clinician discussion around care needs.	Clinician discusses discharge with the patient. Any final assessments or tests are carried out, if required.	
MDT meeting to discuss patient.	MDT meeting to discuss patient.	MDT meeting to discuss patient discharge.

Medway NHS Foundation Trust

# Technology, Innovation and Engagement – the Key Enablers to a Successful Virtual Ward

Tracy Stocker

Director of Operations, Flow and Integration

Medway NHS Foundation Trust

SRO Virtual Ward Programme Medway and Swale HCP

Patient  
**FIRST**

## Health Profile Medway and Swale

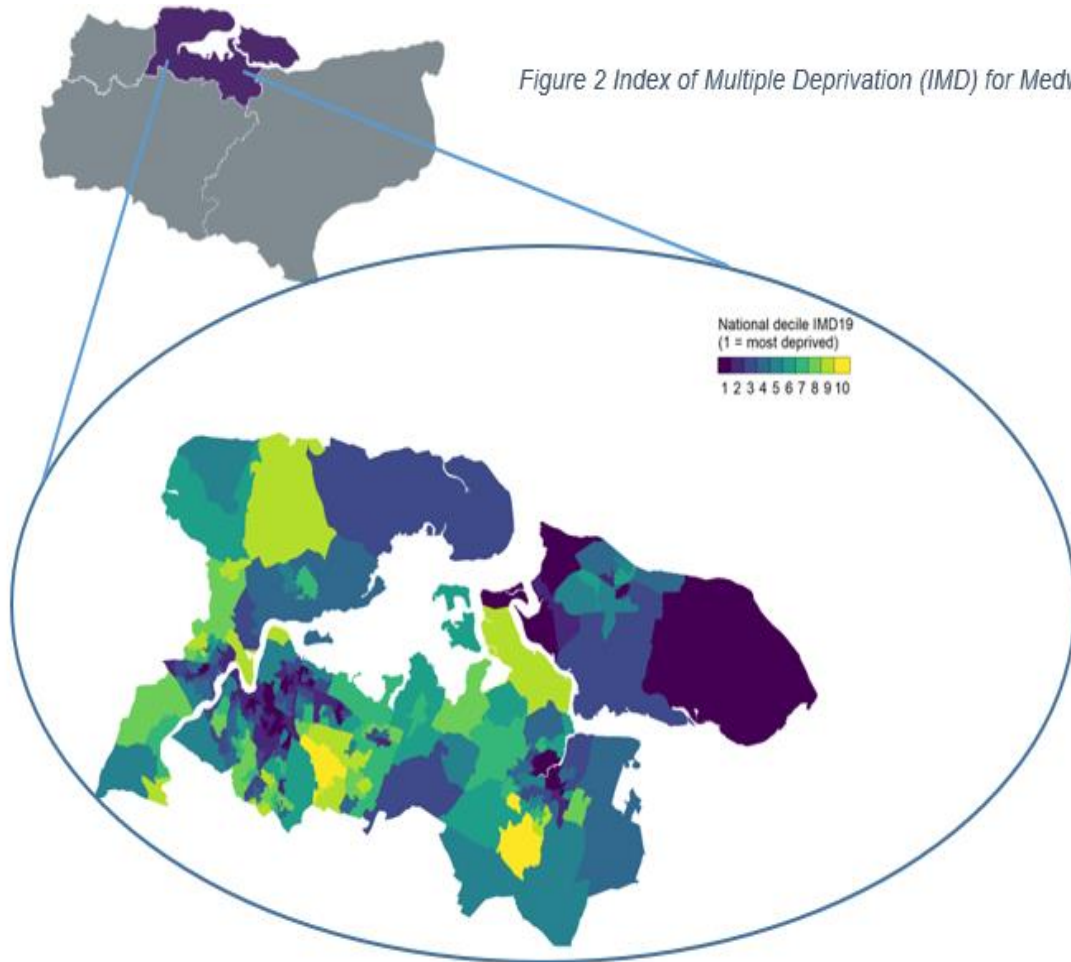

Medway and Swale have some of the highest deprivation levels in the UK, with some wards in the 10 per cent most deprived areas in the country. 52 per cent of residents on the Isle of Sheppey do not have their own means of transport and the duration of a round trip public transport journey from Sheppey to Medway NHS Foundation Trust is 2.5 hours. This results high DNA rates, late presentation of disease, greater complexity due to acuity or the chronic nature of conditions together with increased co-morbidities.

Several factors contribute to the general health of the population. Medway and Swale is comprised of a few rural affluent areas, with the majority of the population residing in large low-income coastal communities, with densely populated deprived urban areas and heavy industry with concomitant pollution associated health risks. These environmental factors along with societal factors associated with deprivation (housing, education, employment opportunities etc.) create specific health care demands for Medway NHS Foundation Trust and its system partners.

The health of the local Medway and Swale population is mixed with 13 national indicators of health scoring better and six worse than the average in England. In addition, Medway NHS Foundation Trust provides healthcare services to some of the most vulnerable members of our community across seven prisons and young offender institutions across Kent and Medway. This population have greater health needs at an earlier age than the general population, adding to acute healthcare demands. This has a significant impact on our bed occupancy and flow from ED through to community and LA provision.

There are health inequalities between ethnic minority and white groups, and between different ethnic minority groups. People from some ethnic minority groups are more likely to report being in poorer health and to report poorer experiences of using health services than their white counterparts. Unpicking the causes of ethnic inequalities in health is difficult. Evidence suggests a complex interplay of many factors including deprivation, environment and health-related behaviours. COVID-19 has shone a light on inequalities and highlighted the urgent need to strengthen action to prevent and manage ill health in deprived and ethnic minority communities.

Figure 2 Index of Multiple Deprivation (IMD) for Medway

# Our Journey

- MFT H@H Service was commissioned in 2009, as An 18 bedded virtual ward to care for patients who required Neb and O2 weaning and IVAB prior to discharge
- Bridging team was an Enhanced Recovery pilot for post op breast/urology and bowel surgery which was established within the surgical directorate in 2011. This pilot was to aid early discharge and admission avoidance.
- The success of the Bridging team led into an expansion of the service to cover the whole of surgery and orthopaedics. In 2013, SPET (Surgical Patients Enhancement Team) was set up.
- In 2018 Further expansion to allow integrating of all Directorates/ specialties led into the amalgamation of SPET and H@H. SMART (Surgical medical acute recovery Team) was born.
- In 2016, Vascular access was launched with SMART to enhance the OPAT Pathway..
- CMDU was launched 2021 to minimise the potential of vulnerable patients contracting COVID, from getting sick enough to warrant a hospital admission
- RPM initially introduced in June 2020 to support in-patient COVID Wards – not fully embedded
- Two weeks later ruled out and RPM introduced to the SMART H@H ward to support our patients

## Bed Capacity for Acute Hospital Discharge and ED

60 with current staffing, regularly in excess of 90, increasing to 100 once recruited

## Community capacity

50 Beds across 2 providers

## Working Hours

8am to 8pm looking to increase to 24hrs

## Out of Hours

111 / 999

# WORKFORCE

- Clinical Nurse Lead
- Vascular Access CNS's
- Clinical Sisters
- Staff nurses
- Physiotherapist
- Nurse Associate's
- Therapy Assistant practitioner
- Clinical support workers
- Admin support

## Medical Cover

Acute physicians, 3 PA weekly, supporting SMART, clinical reviews, medical decision making, MDT, OPAT, and clinical governance

SMART Acute Medicine Specialist Doctor, 12 PA, supporting SMART Mon – Fri

Microbiologist (2 hrs weekly) for MDT OPAT  
On call specialty Drs PRN for planned and trauma / surgical emergency patients

# Inclusion Criteria subject to SMART/MDT risk assessment

- Over 18 years old
- All specialties
- Admitting consultant agrees to transfer with clinical support via the referring Team
- Patient must reside within the Medway Swale catchments area. (If not, then patient must agree to attend SDEC when face to face treatment is required)
- Patient is safe to start acute treatment or continue acute care in an outpatient setting
- Patients / NOK must have access to a telephone in working order ( Remote monitoring to be issued to allow communication with SMART)
- Patient requires only short term care (1-14 days)
- The patient will be able to transfer independently and mobilise short distances safely. However, if they have full time care available within the place of residence, the patient can be accepted onto the scheme
- The patient is compliant with the proposed care and is not confused or disorientated. (Exceptional to living with a responsible fulltime adult or a safe patient tailored safety net can be implemented)
- Any long term complex care needs will be managed by the patient or ongoing care needs must be met by the patient. (e.g. Stoma, catheter, etc.)
- Referral team agree for SMART to directly facilitate re-admission of any patient who requires urgent surgical or medical treatment, via SDEC/SAU/HOT CLINIC/ED via Clinical team on call as expected.
- Patient and family must agree to discharge onto SMART ward.

# Exclusion Criteria

- Patients under 18 (for SMART VW)
- Patients that live alone and their safety cannot be mitigated
- Patients to whom SMART has no clinical skills to provide care to
- Patients who are assessed as lacking capacity to consent (Including Dementia, and a safety net cannot be put in place.
- Patients who are assessed and deemed high risk (Risk to staff due to lone working, if cannot be mitigated, as well as risk to self)
- Patients with altered states of consciousness (fits/cerebral events) There will be individual exception to this rule
- Acutely hypoxic patients
- Patients outside the Medway/Swale GP catchment area There will be individual exception to this rule

## 4. Capacity and Utilisation

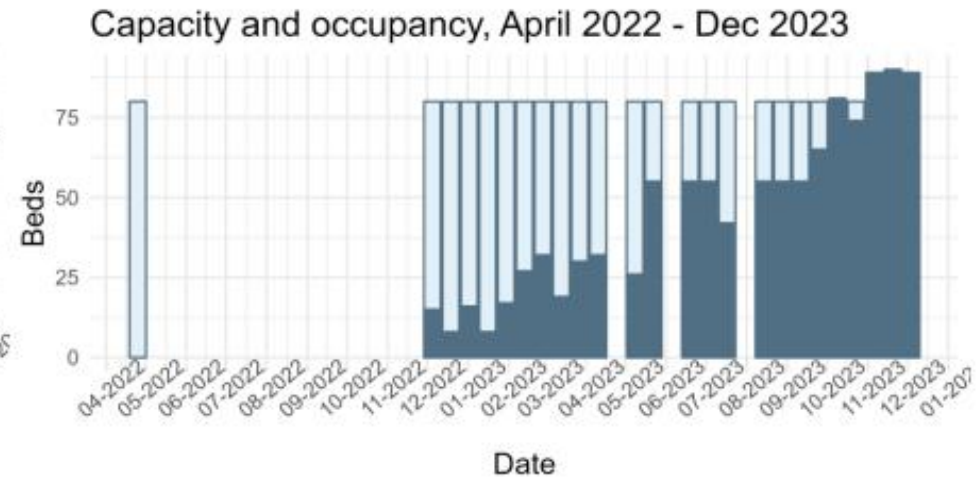

### 4.4 Occupancy rate

Occupancy is captured as a snapshot at 8am on the Thursday in the week prior to submission. Providers should work towards achieving and maintaining occupancy of 80%.

— SMART Virtual Ward  
— National Respiratory, Frailty, COVID and Other Wards

Data notes: VW SitRep

□ capacity ■ occupancy

Data notes: VW SitRep

# One platform, providing technology to enable good quality care at home

**Medway**

NHS Foundation Trust

## Provision of High-quality technology.

Our advanced technology comprises a diverse ecosystem of CE/CA marked devices for continuous vital sign monitoring, and intermittent vital sign capture. This enables remote patient care across diverse clinical pathways.

RPM  
Devices

Telehealth

Clinical  
Dashboard

EPR  
Integration

## Wrap around Programme support.

The delivery of high-class technology alone is not enough for a successful care at home programme, so we've developed extensive wrap-around services to aid your programme's operations.

Professional  
Services

Clinical  
Research

Logistics  
Services

Virtual  
Monitoring Hub

## Our step down Virtual Ward includes:

- Post Operative ESD
- Post Operative direct from Recovery (Breast Surgery & urology Patients)
- Heart Failure
- Respiratory
- Accufuser IV's
- Orthopaedic
- Frailty

## Our step up Virtual Ward includes:

- Heart Failure
- Respiratory
- Frailty
- Acute Clinical Investigations and Monitoring
- Acute Infection Treatments
- Attendance Avoidance, deteriorating patients under the community Virtual Ward reviewed at home by the SMART VW Doctor. PoC testing conducted to aid diagnosis / treatment
- Referred from ED, SDEC, Assessment Units; Community referrals from Community Virtual Ward

## Pilots

- Paediatric pilot
- Neonatal pilot

# A single platform delivering across multiple use cases

**Medway**  
NHS Foundation Trust

## Virtual Wards

Improve the availability of in-patient beds, increase capacity, and reduce unnecessary hospital re-admissions, through the safe enrollment and monitoring of patients on virtual wards.

## Transitional Care

Proactively manage step-up and step-down care to help prepare for a planned hospital admission or a planned patient discharge, whilst retaining clear insight into patient health.

## Chronic Care

Effectively manage large patient populations and deliver preventive care through personalised, low-touch care plans, whilst retaining a holistic, real-time view of patient health.

## Clinical use cases

We provide a configurable platform that can be tailored to the clinical condition and acuity of each patient. Our team of clinical and operational experts will help you design, build, and scale your programme.

### Common use cases include:

Acute Respiratory Infection

Acute Kidney Infection

Frailty

Pre and post surgery

Heart Failure

Diabetes

Oncology

# One dashboard for all clinicians

**Patients stratified by risk.**

**Tags by disease or deployment.**

**Role-based alarms.**

**Integration into the EPR through HL7 or FHIR.**

**Universal view with ability to limit.**

The dashboard features a sidebar with navigation options: Home, Activity, Calls, Management, and Account. The main content area is titled 'High priority (2)' and lists patients with various health indicators and tags. Below this is a 'My list (2)' section and an 'All patients (121)' section, all sorted alphabetically.

**Alarms configurable at population or individual level.**

**Median value displayed in 15 minute increments.**

**Continuous capture from Current Health wearable.**

**Data from peripheral devices.**

**Visual indicator of patient engagement and access to patient reported symptoms.**

**Visual indicator of missing data.**

**Patient demographics and care team notes.**

The patient detail view for Richard Gallagher (ID: 2993827666) shows active alarms for 'Hypoxia - Low SpO2' and 'Weight gain'. A table displays vital signs over time (8:00 to 9:45) for variables like Respiration, Pulse, SpO2, Skin Temp, and Steps. The table includes visual indicators for missing data (diagonal lines) and patient engagement (checkmarks). The right sidebar contains patient information, including demographics, preferred language, ethnicity, phone number, height, weight, program, reason for admission, department, and primary/secondary diagnoses.

# Enabling Care at Home for Everyone

## Collaboration across Acute and Community Providers

One Doctor, based in the Acute, with permission to view all patient data across all organisations reviewing virtual patients

Both of our community organisations has permission only to view their patients (GDPR)

SMART can view all patients as the lead organisation for VW (information sharing agreement)

The screenshot shows a web application interface for 'Medway and Swale Virtual...'. The left sidebar contains navigation options: 'Admit', 'Patients', 'Reports', 'Calendar', 'Management', and 'Account'. The main content area is titled 'Account' and 'Duty Locations'. It lists various locations with checkboxes: HCRG Continuous, HCRG Intermittent, MCH Community Virtual Ward Continuous, MCH Community Virtual Ward Intermittent, MCH Community Virtual Ward OPAT, MCH Community Virtual Ward Respiratory, Shared SMART/MCH OPAT Continuous Respiratory, SMART APP, SMART Continuous (checked), and SMART Intermittent. At the bottom of the sidebar, there are links for 'Instructions for Use' and 'Privacy Policy'. The top right corner of the interface shows 'You are ON d'.

# Care at home Technology

**Medway**  
NHS Foundation Trust

Capture the broadest picture of patient health with access to continuous and intermittent RPM devices in addition to patient-reported data.

## The wearable device.

Our CE/CA-certified wireless biosensor continuously and passively captures vital signs with the same accuracy of an ICU monitor, providing hospital-grade monitoring at home for (PROMS) patients.

## Best-in-class peripheral devices.

Devices come preconfigured as part of our kit for easy patient setup. Data is transmitted wirelessly and integrated into our clinical dashboard for a single view of patient health.

## Patient reported outcomes (PRO).

Daily activity data and self-reported symptoms provide a holistic picture of patient health and help teams to monitor care, plan engagement and medication adherence.

-  Pulse rate
-  Respiration rate
-  Mobility and step count
-  Oxygen saturation
-  Body temperature

OMRON  
Blood Pressure

Auxiliary Temperature

Oxygen saturation

MIR  
Spirometry

iHealth  
Weight

# Care at home Technology

Making care at home accessible for diverse patient populations

Medway

NHS Foundation Trust

## Connectivity for all

We provide everything the patient needs to get online, including cellular connectivity with a SIM card, a secure connection, and a tablet to help increase our patients.

**88%**

of patients 'strongly agree' or 'agree' it was easy to set up the kit<sup>14</sup>

No action is needed to share their data, everything is transferred to the Current Health platform through wireless connection.

## Simplified instructions

Easy, clear, and visual instructions for patients with low literacy levels – all patient-facing content written at age 10-13 reading level, translated in to multiple languages.

# Benefits and efficiencies

## MFT identified recurrent non-cashable productivity benefits:

Data from November 2022 to October 2023 was analysed at spell level, the key data being occupied bed days, and cost difference between acute physical beds and virtual ward beds as the key metrics in calculating these benefits.

During this period 8,848 bed days of virtual ward activity were carried out, potentially saving 8,848 bed days of acute hospital in-patient admissions.

The cost of virtual ward bed (FY23 costing) is £130 per day, whilst average cost of in-patient acute hospital bed is £433 per day.

## From this analysis:

Total av. cost of activity if all 8,848 bed days were in acute physical hospital beds is £3.83M

Total cost of the same activity and bed days in virtual wards is £1.15M

Cost differential benefits (productivity savings) on the 8,848 bed days spanning Nov 22 to Oct 23 is calculated as £2.68M

## During the stated 12 months period:

959 virtual ward spells were carried out.

Of this, 402 were electives which provides additional benefit in delivering our elective recovery plan and supports an increase in elective flow

## Overall, virtual wards benefits could be summarised into the following:

- Length of stay reduction in a physical bed
- Workforce efficiencies – with potential release of clinical time for direct clinical care in the acute setting
- Readmission rate reduction
- Admission avoidance – especially from ED
- Release of elective and elective beds
- Improved flow across the trust supporting the front door

The most important benefit is to our patients; Our tech enabled VW addresses many health inequalities across our HCP (smart device, connectivity, location, access to transport, carer responsibilities, discharge from recovery) . Evidence suggests patients have better recovery at home with improved experience and outcomes.

Feedback from our patients and carers;

*“Very good support after operation. Especially for people on their own and having the tablet to stay in contact is a really good idea”*

*“Better alternative to hospital stay”      “Very efficient feel safer”*

*“Much better at home than having to stay in hospital for the same treatment”*

*“It nice to know that I'm being monitored without having to be in hospital. There's always someone at the end of the phone if you need reassurance and them checking in that everything is OK”*

NHS Foundation Trust

# Neonatal Virtual Ward Pilot

## Why we decided to do it?

Establishing feeding is often the final area holding babies back from being discharged from the Neonatal Unit once medically fit in all other areas clinically.

This can be frustrating for parents, especially when they have other children at home to split their time between, long distances to travel, and the separation of families in general.

Sending these babies home earlier NGT feeding reunites families, promotes Family Integrated Care, improves parental confidence, improves developmental outcomes and reduces the demand on neonatal cots.

## How are we using tech?

The Virtual Ward has funded scales for the Short-Term Home NGT Service, which has enabled us to loan the scales to families for the duration of their early discharge so that parents can weigh their babies daily, reducing the Outreach Team's travel time for daily home visits.

## Criteria

Brief Criteria for the Short-Term Home NGT Service:

Corrected gestation 34 weeks

Current weight >1.6kg

Clinically Well

Maintaining temperature

Feeding: taking two full suck feeds in 24 hours

SaLT assessment completed

Location within Outreach region

Parents completed Unit NGT competencies

## About the team

At Medway the Neonatal Outreach Team are a team of experienced Neonatal Nurses and Clinical Support Workers, who support families from admission through to discharge and beyond. This can include referrals to outside agencies and charities, mental health support and home visits post discharge. We also run the Short-Term Home NGT service, ROP clinic, RSV Clinic, Home Oxygen and deal with all safeguarding for the unit.

# Case Study

## Virtual Ward

Utilisation of remote patient monitoring to improve capacity and reduce acute bed requirements.

### The issue

Identifying opportunities to support post-op patients out of the acute hospital at the start of and during Covid. 

Our post-op breast patients who needed a surgical drain that requires acute monitoring prior to discharge, were being admitted onto a ward with an average seven day length of stay in an acute bed for monitoring. 

Daily visits to support these patients by the team was not practical due to capacity. 

Patient reviews carried out by phone led to patients receiving a face-to-face visit most frequently because patients, descriptions of concerns needed clinically verifying. 

This put additional pressure on the service to accommodate a patient often resulting in a couple of days stay in an acute bed before they could be transferred to the SMART team. 

### What we did to make a difference

**1** Hospital at Home pathways for inpatients suggest daily face-to-face visits to ensure patient safety. However, the introduction of Remote Patient Monitoring (RPM) enabled SMART to accept patients directly from recovery when safe to go home, directly onto the virtual ward.

**2** Patients were educated on post-op pain control and taught how to change redivac bottle.

**3** All patients are called twice daily via video and remotely monitored via RPM.

**4** Patients have a chat link to communicate with the SMART virtual hub nurses.

**5** Patients feel empowered by being involved in their care.

**6** We have a ratio of 1 HCP to 20 patients on our virtual pathway.

**7** RPM requires less face-to-face interaction and more virtual care.

In April 2023, twelve patients were directly admitted onto the virtual ward (VW) following breast surgical procedures.

The combined length of stay (LOS) on the VW was **73 days average 6.08 days**. The majority of these patients had drains in place and require some remote monitoring via RPM technology. There were 27 face-to-face visits by SMART practitioners across these patients who were supported via Remote Patient Monitoring (RPM) technology. These patients were brought back in for the drain to be removed and then discharged from the SMART virtual ward.

This pathway provided a **73-day elective bed saving in April** which provides an efficiency in length of stay and flow and a cost avoidance. This pathway enables these physical elective beds to be used for other elective patients, freeing up bed days to enable additional elective activity which will contribute towards meeting/exceeding operational planned activity.

### Our key outcomes

Average LOS of a breast patient is **seven days on a ward**, this saves an average **seven acute bed days per patient**

**Face-to-face interaction 2x weekly** for wound review and bottle change if required.

Patients are able to **recover in their home environment** which is generally agreed as a driver for quality health outcomes 

**Pain well controlled** due to self-medication. 

**Bed day efficiency** which supports improvement in our elective capacity. 

**THANK YOU**

# Virtual Care, Effective Care

Dr Iain Goodhart

FRCA FFICM MPhil MA

It was the most marvellous and efficient service. There was never a delay in speaking to someone and the support and advice around pain management and medication was superb. I had suffered a pulmonary embolism on 25 th May and needed to be stabilised before undergoing a 2nd operation on 9 th June. After 8 days as an in patient I was visibly deteriorating psychologically and physically after being on a short staffed overcrowded noisy ward with no daylight. By being discharged to the comfort and peace of my beautiful home I was in the best possible psychological and physical state to undergo further surgery which I am pleased to report was successful
